Total Contact Hours	36			
Pre-requisites	None			

Learning Objective:

In this course, students will learn about the fundamentals of electrical circuits, focusing on both DC and AC circuits, transformers, and rotating machines.

Course Outcome:

CO1: Understand and remember the working principles of basic electrical circuits, power distribution, and safety measures.

CO2: Analyze the functioning of DC and AC circuits.

CO3: Understand and remember the basic principles of transformers and rotating machines.

CO4: Analyze and evaluate the performance of electrical circuits, transformers, and rotating machines through laboratory experiments and simulations.

CO5: Design basic electrical circuits and systems, considering safety, efficiency, and economic factors.

Course Content:

Module 1: DC Circuits Fundamentals

[9L]

- Electric circuits: Linear circuit, Non-linear circuit, Bilateral circuit, Unilateral circuit, Dependent source, Node, Branch, Active and Passive elements, Kirchhoff's laws, Source equivalence and conversion.
- Network Theorems: Superposition theorem, Thevenin's theorem, Norton's theorem, Maximum power transfer theorem.

Module 2: AC Circuits Fundamentals

[9L]

- Sinusoidal quantities: Average and RMS values, Peak factor, Form factor, Phase and Phase difference, Concept of phasor diagram, V-I relationship in R, L, C circuits, R-L-C circuits in series and parallel with phasor diagrams, Impedance and Admittance, Impedance triangle and Power triangle, Power factor.
- Three-phase balanced circuits, Concept of three-phase power measurement.

Module 3: Single-Phase Transformer

[5L]

- Single-phase transformer: Idea on constructional parts, Classifications, Working principle. Numerical on EMF equation, Phasor diagram.

Module 4: Electrical Rotating Machines

[8L]

- DC Machines: Constructional features, Classifications, Working principle of Generator and Motor. Simple Numerical on voltage equation.

- Three-phase Induction Motor: Basic concept of Three Phase circuit and Production of Rotating Magnetic Field, Working principle of Three Phase Induction Motor and Torque-Speed Characteristics (concept only).

Module 5: Electrical Installations

[5L]

- Power generation to distribution through overhead lines and underground cables with single-line diagram. Earthing of electrical equipment, Basic accessories: MCB, MCCB, ELCB, SFU, Megger.

Pre-requisites	None			

Learning Objectives:

The goal of this course is to achieve conceptual understanding and to retain the best traditions of traditional calculus. The syllabus is designed to provide the basic tools of calculus mainly for the purpose of modelling the engineering problems mathematically and obtaining solutions. This is a foundation course which mainly deals with topics such as single variable and multivariable calculus and plays an important role in the understanding of science, engineering, economics and computer science, among other disciplines.

Course Outcome:

CO1: To apply differential and integral calculus to notions of curvature and to improper integrals. Apart from some other applications they will have a basic understanding of Beta and Gamma functions.

CO2: The fallouts of Rolle's Theorem that is fundamental to application of analysis to Engineering problems.

CO3: The tool of power series and Fourier series for learning advanced Engineering Mathematics.

CO4: To deal with functions of several variables that is essential in most branches of engineering.

CO5: To acquaint the student with mathematical tools needed in evaluating multiple integrals and their usage

Course Content:**Module 1: Basic Calculus:****[6L]**

Curvature, evolutes and involutes; Evaluation of definite and improper integrals; Beta and Gamma functions and their properties; Applications of definite integrals to evaluate surface areas and volumes of revolutions. .

Module 2: Single-variable Calculus (Differentiation):**[6L]**

Rolle's Theorem, Mean value theorems and applications; Extreme values of functions; Linear approximation; Indeterminate forms and L' Hospital's rule..

Module 3: Sequences and series:**[8L]**

Limits of sequence of numbers, Calculation of limits, Infinite series; Tests for convergence; Power series, Taylor and Maclaurin series; Taylor theorem, convergence of Taylor series, error estimates..

Module 4: Multivariable Calculus (Differentiation):**[6L]**

Limit, continuity and partial derivatives, directional derivatives, gradient, total derivative; Tangent plane and normal line; Maxima, minima and saddle points; Method of Lagrange multipliers.

Module 5: Multivariable Calculus (Integration):**[10L]**

Multiple Integration: Double integrals (Cartesian), change of order of integration in double integrals, Change of variables (Cartesian to polar), Applications: areas and volumes, Center of mass and Gravity (constant and variable densities); Triple integrals (Cartesian), orthogonal curvilinear coordinates, Simple applications involving cubes, sphere and rectangular parallelepipeds; Scalar line integrals, vector line integrals, scalar surface integrals, vector surface integrals, Gradient, curl and divergence, Theorems of Green, Gauss and Stokes..

Course Code	YPH1001			
Course Title	Engineering Physics			
Category	Basic Science			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	None			

Learning Objective:

The objective of the course is to provide students with a sufficient understanding of physics' foundational ideas and their potential applications. Understanding the fundamentals of physics will enable engineers to better comprehend the instruments and methods employed in the field and lay the groundwork for introducing novel ideas. It can also raise awareness of the crucial part that engineering and science play in the creation of new technologies. Additionally, it provides the required exposure to the practical aspects, which is a vital component of studying the sciences.

Course Outcome:

CO1: To understand and remember the basic principles of Classical Mechanics, Relativistic Mechanics, Quantum Mechanics, Statistical Mechanics, and microscopic phenomena.

CO2: To understand the working principles of laser, optical fiber, and holography amplifier and analyze their various applications to enhance knowledge in modern optics.

CO3: To learn the basic principles of electromagnetic induction, dielectric properties, and magnetic properties of materials.

CO4: To understand and apply knowledge in new technologies.

CO5: To apply the principles of physics to solve engineering problems and analyze real-world phenomena.

Course Content:

Module 1: Mechanics

[8L]

- Representation of vector, scalar, and vector fields, partial derivative of vector, gradient of scalar field, divergence, and curl of vector field.
- Friction, conservation laws, rigid body, moment of inertia, acceleration of rigid body, Mass-energy Equivalence Concept of photon.

Module 2: Quantum Theory

[8L]

- Blackbody Radiation spectrum, Wein's law, Rayleigh-Jeans law, Quantum theory of radiation, Wave mechanics, wave-particle duality, De Broglie waves, Bohr's quantization rules, Phase and group velocities, Davisson-Germer Experiment, Heisenberg Uncertainty Principle, Wave function and its significance, Schrodinger's wave equation.

Module 3: Laser, Fiber Optics

[6L]

- Spontaneous and stimulated emission of radiation, Population inversion, Einstein's coefficients, Basic components of laser system, Construction and working of Ruby laser, He-Ne lasers, Laser Applications. Basic ideas of Fiber optics.

Module 4: Statistical Mechanics and Applications

[6L]

- Introduction to Statistical mechanics, Concept of energy levels and energy states. Classical limits of quantum statistics, Concept of Fermi level. Fermi level in metals, Fermi level for intrinsic and extrinsic semiconductors (pictorial representations on temperature dependence and doping concentration viz. p-type, n-type).

Module 5: Electromagnetic Induction

[3L]

- Magnetic flux, Faraday's law of electromagnetic induction, electromotive force, Ampere's circuital law, Maxwell's equation.

Module 6: Dielectrics

[3L]

- Types of dielectric, relation between dielectric constant and electric susceptibility, polarizability, Clausius-Mossotti Equation, application of dielectric materials.

Module 7: Magnetic Properties of Materials

[2L]

- Magnetic flux density, magnetic permeability, magnetic susceptibility, classification of magnetic materials, diamagnetic materials, paramagnetic materials, Curie law.

LTP & Credits	L	T	P	Credit
	3	1	0	4
Total Contact Hours	48			
Pre-requisites	None			

Learning Objective:

Algorithmic skill is a fundamental skill in modern times, and this course provides the students with the foundations of computational problem solving. The course emphasizes on principles and methods rather than on systems and tools.

Course Outcome:

- CO1:** Understand the basic model of computation
CO2: Apply algorithmic thinking to understand, and solve problems
CO3: Design and implement algorithms for a given problem
CO4: Implement algorithms using a high-level programming language
CO5: Analyze and evaluate algorithms for efficiency and correctness

Course Content:

Module 1: Problem Solving and Algorithmic Thinking

[6L]

Overview - problem definition, logical reasoning. Flowcharts - symbols used, examples. Algorithm - definition, practical examples, properties, representation, algorithms vs programs. Elementary concepts about time complexity

Module 2: Introduction to Computation

[10L]

Introduction to Computing – Computer Systems-Hardware and Software, Computer Languages, Algorithm, Flowchart, Representation of Algorithm and Flowchart with examples. Introduction to C– History of C, Features of C, Structure of C Program, Character Set, C Tokens-Keywords, Identifiers, Constants, Variables, Data types, Operators.

.Module 3: Function of C

[8L]

Functions-Designing Structured Programs, Types of Functions-User defined functions, Standard functions, Categories of functions, Parameter Passing techniques, Recursion.

Module 4: Array and String

[8L]

Arrays- Declaration and Initialization, One dimensional Array, Two dimensional Arrays. Strings- Declaration and Initialization, String Input / Output functions, String manipulation functions.

Module 5: Pointers and Structure

[9L]

Pointers- Introduction, Definition and Declaration of pointers, address operator, Pointer variables, Pointers with Arrays. Structures- Introduction, Declaration and Initialization, Array of Structures, Unions.

Module 5: File Handling in C

[6L]

Input and Output – Concept of a file, streams, text files and binary files, Differences between text and binary files, State of a file, Opening and Closing files, file input / output functions (standard library input / output functions for files), file status functions (error handling), Positioning functions.

Learning Objective(s):

To facilitate students with the concepts of Indian traditional knowledge and to make them understand the importance of roots of the knowledge system. To make students understand traditional knowledge and analyze it and apply it to their day-to-day life.

Course Outcomes:

- CO1: Provide an overview of the concept of the Indian Knowledge System and its importance.
 CO2: Appreciate the need and importance of protecting traditional knowledge.
 CO3: Recognize the relevance of Traditional knowledge in different domains.
 CO4: Establish the significance of Indian Knowledge systems in the contemporary world.
 CO5: Evaluate the impact of Indian Knowledge Systems on global perspectives.

Course Content:

Module 1: Introduction to Indian Knowledge Systems (IKS): [8L]

Overview, Vedic Corpus, Philosophy, Character scope and importance, traditional knowledge vis-a-vis indigenous knowledge, traditional knowledge vs. western knowledge.

Module 2: Traditional Knowledge in Humanities and Sciences: [8L]

Linguistics, Number and measurements- Mathematics, Chemistry, Physics, Art, Astronomy, Astrology, Crafts and Trade in India and Engineering and Technology.

Module 3: Traditional Knowledge in Professional domain: [8L]

Town planning and architecture- Construction, Health, wellness and Psychology-Medicine, Agriculture, Governance and public administration, United Nations Sustainable development goals.

CO5	2	1	1	1	2	2	0	0	2	0	0	3	0	0	3

Course Code	YCS 1103			
Course Title	Workshop/Manufacturing Practices Laboratory			
Category	ENGG Skill Enhancement			
LTP & Credits	L	T	P	Credits
	0	0	3	1.5
Total Contact Hours	36			
Pre-requisites	Physics & Mathematics (10+2 Level)			

Course Outcomes:

After successful completion of this course, learners will be able to:

CO1: Identify and operate various hand tools related to a variety of manufacturing operations.

CO2: Safely fabricate simple components with their own hands.

CO3: Gain practical knowledge of the dimensional accuracies and tolerances applicable for different manufacturing processes.

CO4: Produce small devices of their interest for project or research purposes.

CO5: Apply safety standards and regulations in workshop environments to ensure the well-being of oneself and others.

Course Content:

(i) Theoretical discussion & videos: 3P

1. Manufacturing Methods - casting, forming, machining, joining, advanced manufacturing methods
2. Fitting operations & power tools
3. Carpentry

4. Welding (arc welding & gas welding), brazing
5. Electrical & Electronics
6. Metal casting
7. CNC machining, Additive manufacturing
8. Plastic molding & Glass Cutting

(ii) Workshop Practice:

Module 1: Machine shop 6P Typical jobs that may be made in this practice module: i. To make a pin from a mild steel rod in a lathe. ii. To make rectangular and vee slot in a block of cast iron or mild steel in a shaping and / or milling machine.

Module 2: Fitting shop 6P Typical jobs that may be made in this practice module: i. To make a Gauge from MS plate.

Module 3: Carpentry 6P Typical jobs that may be made in this practice module: i. To make wooden joints and/or a pattern or like.

Module 4 : Welding shop (Arc welding 3P + gas welding 3P) 3P Typical jobs that may be made in this practice module: i. ARC WELDING (3P): To join two thick (approx 5mm) MS plates by manual metal arc welding. ii. GAS WELDING (3P): To join two thin mild steel plates or sheets by gas welding.

Module 5 : Electrical & Electronics 3P House wiring, soft soldering

Module 6: Smithy 3P Typical jobs that may be made in this practice module: R21 B. Tech (ME) i. A simple job of making a square rod from a round bar or similar. For further study (Optional)

Module 7: Casting 3P Typical jobs that may be made in this practice module: i. One/ two green sand molds to prepare, and a casting be demonstrated.

Module 8: Plastic molding & Glass Cutting 3P Typical jobs that may be made in this practice module: i. For plastic molding, making at least one simple plastic component should be made. ii. At least one sample shape on glass should be made using laser cutting machine. Examinations could involve the actual fabrication of simple components, utilizing one or more of the techniques covered above.

Course Title	Programming for Problem solving Laboratory			
Category	ENGG Major			
LTP & Credits	L	T	P	Credit
	0	0	3	1.5
Total Contact Hours	36			
Pre-requisites	Basic Understanding of Computer			

Learning Objective:

The course is oriented to those who want to advance structured and procedural programming understanding and to improve C programming skills. The major objective is to provide students with an understanding of code organization and functional hierarchical decomposition using complex data types.

Course Outcomes:

CO1: Learn and understand the DOS system commands and familiarize with C programming environment.

CO2: Learn and translate the algorithms into simple programs and understand the flowchart design and test.

CO3: Understand and implement conditional branching, iteration and recursion.

CO4: Apply and analyze various C programs with Arrays, Pointers, Structures, Union along with functions.

CO5: Apply programming to solve matrix addition and multiplication problems and understand the file handling.

Course Content:

Suggestive List of Experiments:

1. Familiarization with basic DOS commands and programming design with the help of Flowcharts Using Raptor. [1 day]

2. Familiarization with C programming environment, Variable types and type Conversions, Simple Computational problems using arithmetic expressions. [1 day]
3. Branching and logical expressions, Problems involving if-then-else structures. [1 day]
4. Loops, while and for loops, Iterative problems e.g., sum of series, patterns print. [2 days]
5. 1D Arrays: searching, sorting, 1D Array manipulation, 2D arrays and Strings, Matrix problems, String operations. [2 days]
6. Functions, call by value, Simple functions implementations, function recursion. [2 days]
7. Pointers, structures and dynamic memory allocation, Union. [2 days]
8. File handling, file reading, writing, copying etc. [1 day]

Pre-requisites	None			

Learning Objective:

The objective of this course is to revise the basic concepts of physics through a standard set of experiments to correlate them with the corresponding theory.

Course Outcomes:

CO1: To discover an idea of different measurements and errors.

CO2: To understand and apply basic laws of physics and experiments.

CO3: To practice and generate experimental skills in different areas of physics and applications.

CO4: To analyze experimental data using appropriate statistical methods and tools to draw meaningful conclusions and make predictions.

CO5: To communicate experimental procedures, observations, and results effectively through written reports and oral presentations.

Course Content:

Suggestive List of Experiments:

1. General idea about Measurements and Errors: i) Error estimation using Slide calipers/Screw-gauge/traveling microscope for one experiment. ii) Proportional error calculation using Carey Foster Bridge. [2 days]
2. Determination of wavelength of light by Newton's ring method. [1 day]
3. Determination of wavelength of light by Laser diffraction method. [1 day]
4. Determination of Planck's constant using photoelectric cell. [1 day]
5. Verification of Bohr's atomic orbital theory through Frank-Hertz experiment. [2 days]
6. Determination of Stefan's constant. [1 day]
7. Determination of bandgap of a semiconductor. [1 day]
8. Study of dispersive power of material of a prism. [1 day]
9. Measurement of nodal and antinodal points along transmission wire and measurement of wavelength. [1 day]
10. Determination of wavelength of light by Fresnel's bi-prism method. [1 day]

Pre-requisites	None			

Learning Objective:

In this course, students will learn about the basic electrical components, machinery, instruments, and safety measures.

Course Outcomes:

CO1: Identify and apply common electrical equipment and instruments.

CO2: Develop electric networks using various components and analyze the circuit behavior.

CO3: Apply and analyze the basic characteristics of transformers and electrical machines.

CO4: Demonstrate an understanding of the characteristics and operation of different types of electrical machines.

CO5: Analyze and interpret data from electrical experiments, draw conclusions, and make recommendations based on the findings.

Course Content:

List of Experiments:

1. Basic safety precautions – Earthing, Introduction to measuring instruments – Voltmeter, Ammeter, Multimeter, Wattmeter, Real-life Resistor, Capacitor, Inductor.
2. Verification of Thevenin's and Norton's Theorem.
3. Verification of Superposition and Maximum Power Transfer Theorem.
4. Characteristics of Fluorescent, Tungsten, and Carbon filament lamps.
5. Study of R-L-C series circuit.
6. Three-phase Power measurement with two wattmeter methods.
7. Demonstration of cut-out sections of machines: DC Machine (commutator-brush arrangement), Induction Machine (squirrel cage rotor).
8. Measurement of primary and secondary voltage and current of a single-phase transformer – Open Circuit and Short Circuit Test.
9. Starting, Reversing, and speed control of DC shunt motor.
10. Torque-Speed characteristics of DC Machine.
11. Torque-Speed characteristics of Three-phase Induction Motor.
12. Test on a single-phase Energy Meter.
13. Innovative experiments.

UNIVERSITY

Semester 2 Curriculum and Syllabus

UNIVERSITY

Course Code	YCS2001			
Course Title	Basic Electronics			
Category	SCI Multi Displ			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	None			

Learning Objective:

In this course, students will learn about the fundamental behavior and principle of operations of various electronic devices and circuits. At the end of the course, students will be able to design useful electronic subsystems like rectifiers, amplifiers, etc.

Course Outcome:

- CO1:** To understand and remember the principle of operation of semiconductor devices.
- CO2:** To understand and analyze the operations of P-N junction diodes, bipolar and field-effect transistors, and solve design problems.
- CO3:** To understand and remember the principle of working of operational amplifiers and demonstrate its various applications.
- CO4:** Design and analyze electronic circuits incorporating semiconductor devices and operational amplifiers to meet specified requirements.
- CO5:** Troubleshoot and optimize electronic circuits using diagnostic tools and techniques.

Course Content:

Module 1: Fundamentals of Semiconductor

[6L]

- Conductors, Insulators, and Semiconductors
- Energy band diagrams
- Fermi Dirac function, Fermi level
- Intrinsic and Extrinsic (p-type and n-type) semiconductors
- Drift and Diffusion current
- Mass action law
- Conductivity in semiconductor
- Einstein relationship in semiconductor
- Numerical problems

Module 2: P-N Junction Diode and its Applications

[8L]

- P-N junction diode, Characteristics, and parameters
- Diode equation, V-I characteristics
- P-N junction breakdown: conditions, avalanche, and zener breakdown
- Zener diode and characteristics
- Diode half-wave and full-wave rectifiers (centre tapped and bridge) circuits and operation,

ripple factor, efficiency, reduction of ac ripples using filter circuit (Qualitative analysis)

- Design of diode clipper and clamper circuit
- Application of Zener diode in regulator circuit
- Numerical problems

Module 3: Bipolar Junction Transistor

[6L]

- BJT operation: PNP and NPN transistors
- Transfer characteristics, Current conduction mechanism
- Common Emitter, Common Base, Common Collector configurations and Static characteristics
- Junction biasing condition for active, saturation, and cut-off modes
- DC load line and Quiescent point
- BJT biasing, BJT as an amplifier
- Numerical problems

Module 4: Field Effect Transistor

[6L]

- Classification of field-effect transistors: JFET, MOSFET
- Operating principle of JFET
- Drain and Transfer characteristics of JFET (n-channel and p-channel)
- CS, CG, CD configurations
- Relation between JFET parameters
- FET as an amplifier
- E-MOSFET (n-channel and p-channel), D-MOSFET (n-channel and p-channel)
- Numerical Problems

Module 5: Feedback and Operational Amplifier

[8L]

- Concept of feedback: Positive and Negative feedback, Gain with feedback, Feedback topologies
- Operational Amplifier: Ideal characteristics, Non-ideal characteristics of op-amp – offset voltages, bias current, offset current, slew rate, CMRR, and bandwidth
- Inverting and Non-inverting amplifier
- Concept of virtual ground and virtual short
- Applications of op-amp: Adder, Differential Amplifier, Differentiator, Integrator
- Numerical problems

Module 6: Electronic Instruments and Measurements

[2L]

- Basics of measurement
- Cathode-Ray Oscilloscope and Digital-Storage Oscilloscope
- Measurement of voltage, frequency, and phase
- Signal generators and analytical instruments

	3	1	0	4	
Total Contact Hours	48				
Pre-requisites	Basic Programming				

Learning Objective:

In this course, students will be taught about the significance of non-linear data structures with respect to the access and organization of data, various algorithmic approaches to write programs to solve problems in different engineering domains by using different data structures, merits and demerits of altered algorithms in terms of time-complexity.

Course Outcome:

CO1: To differentiate how the choices of data structure and algorithm methods impact the performance of a program.

CO2: To solve problems based on different data structures and also write programs.

CO3: To identify appropriate data structure and algorithmic methods in solving a problem.

CO4: To discuss the computational efficiency of the principal algorithms for sorting, searching, and hashing.

CO5: To compare and contrast the benefits of dynamic and static data structures implementations.

Course Content:

Module 1: Introduction of Data Structure

[8L]

- Concepts of data structures, Abstract Data Type.
- Algorithms and programs, basic idea of pseudo-code, Properties of an algorithm.
- Algorithm efficiency and analysis, time and space analysis of algorithms – Order notations.
- Array: Different representations – row major, column major.
- Sparse matrix – its implementation and usage, Array representation of polynomials.

Module 2: Linear Data Structure

[14L]

- Stack and its implementations (using array and linked list).
- Applications (Infix, Prefix, and Postfix with their conversions, Postfix Evaluation).
- Queues, circular queue, de-queue.
- Implementation of queue- linear and circular (using array and linked list).

- Recursion: Principles of recursion - use of stack, tail recursion. Applications - The Tower of Hanoi, Eight-queen problem.
- Linked List: Singly linked list – operations, doubly linked list – operations.
- Circular linked list – operations, Linked list representation of polynomial and applications

Module 3: Nonlinear Data Structure

[18L]

- Trees: Basic terminologies, forest, tree representation (using array and linked list).
- Binary trees - binary tree traversal (pre-, in-, post- order).
- Threaded binary tree – operations.
- Binary search tree- operations (creation, insertion, deletion, searching).
- Concept of Max-Heap and Min-Heap (creation, deletion).
- Height balanced binary tree – AVL tree (insertion, deletion with examples only).
- Graph traversal and connectivity – Depth-first search (DFS), Breadth-first search (BFS) – concepts of edges used in DFS and BFS (tree-edge, back-edge, cross-edge, and forward-edge).
- Minimal spanning tree – Prim’s algorithm, Kruskal’s algorithm (basic idea of greedy methods).

Module 4: Searching and Sorting

[8L]

- Sorting Algorithms: Bubble sort, Insertion sort, Selection sort – with the notion of complexity.
- Quick sort, Merge sort – with complexity, Radix sort – with complexity.
- Searching: Sequential search, Binary search, Interpolation Search– with complexity.
- Hashing: Hashing functions, Collision resolution techniques.

LTP & Credits	L	T	P	Credits
	3	1	0	4
Total Contact Hours	48			
Pre-requisites	None			

Learning Objective:

In this course the students will learn about the Mathematics fundamental necessary to formulate, solve and analyze engineering problems.

Course Outcomes:

CO1: To use mathematical tools to evaluate multiple integrals and vector integrals.

CO2: To apply effective mathematical tools for the solutions of ordinary differential equations that model physical processes.

CO3: To understand the properties of Laplace Transform to evaluate multiple integrals and their usage

CO4: To understand the concept of Laplace transform to solve ordinary differential equations.

CO5: Apply mathematical concepts and techniques to analyze and solve engineering problems involving double and triple integration, ordinary differential equations, and Laplace transforms, demonstrating proficiency in mathematical modeling and problem-solving skills.

Course Content:

Module 1: Matrices

[6L]

Linear Systems of Equations; Linear Independence; Rank of a Matrix; Determinant, Inverse of a matrix, rank-nullity theorem; System of linear equations; Symmetric, skew-symmetric and orthogonal matrices; Determinants; Eigenvalues and eigenvectors; Orthogonal transformation; Diagonalization of matrices.

Module 2: First order ordinary differential equations:

[6L]

Exact, linear and Bernoulli's equations. Equations not of first degree: equations solvable for p , equations solvable for y , equations solvable for x and Clairaut's type.

Module 3: Ordinary differential equations of higher orders:

[8L]

Second order linear differential equations with variable coefficients: Euler-Cauchy equations, solution by variation of parameters; Power series solutions: Legendre's equations and Legendre polynomials, Frobenius method, Bessel's equation and Bessel's functions of the first kind and their

properties.

Module 4: Complex Variable – Differentiation:

[8L]

Differentiation, Cauchy-Riemann equations, analytic functions, harmonic functions, finding harmonic conjugate; elementary analytic functions (exponential, trigonometric, logarithm) and their properties; Conformal mappings, Mobius transformations and their properties.

Module 5: Complex Variable – Integration:

[8L]:

Contour integrals, Cauchy-Goursat theorem (without proof), Cauchy Integral formula (without proof), Liouville's theorem and Maximum-Modulus theorem (without proof); Taylor's series, zeros of analytic functions, singularities, Laurent's series; Residues, Cauchy Residue theorem (without proof), Evaluation of definite integral involving sine and cosine, Evaluation of certain improper integrals using the Bromwich contour

Category	Basic Science			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	None			

Learning Objective:

The objective of the Chemistry-I is to acquaint the students with the basic phenomenon/concepts of chemistry, the student faces during course of their study in the industry and Engineering field. The student with the knowledge of the basic chemistry will understand and explain scientifically the various chemistry related problems in the industry/engineering field. The student will be able to understand the new developments and breakthroughs efficiently in engineering and technology. The introduction of the latest (R&D oriented) topics will make the engineering student upgraded with the new technologies.

Course Outcome:

- CO1:** Analyze microscopic chemistry in terms of atomic and molecular orbitals and intermolecular forces.
CO2: Rationalize bulk properties and processes using thermodynamic considerations.
CO3: Distinguish the ranges of the electromagnetic spectrum used for exciting different molecular energy levels in various spectroscopic techniques
CO4: Rationalize periodic properties such as ionization potential, electro negativity, oxidation states and electro negativity.
CO5: List major chemical reactions that are used in the synthesis of molecules.

Course Contents:

Module 1: Atomic and molecular structure [12L]

Schrodinger equation. Particle in box solutions and their applications for conjugated molecules and nanoparticles. Forms of the hydrogen atom wave functions and the plots of these functions to explore their spatial variations. Molecular orbitals of diatomic molecules and plots of the multicentre orbitals. Equations for atomic and molecular orbitals. Energy level diagrams of diatomic. Pi-molecular orbitals of butadiene and benzene and atomicity. Crystal field theory and the energy level diagrams for transition metal ions and their magnetic properties. Band structure of solids and the role of doping on band structures.

Module 2: Spectroscopic techniques and applications [6L]

Principles of spectroscopy and selection rules. Electronic spectroscopy. Fluorescence and its applications in medicine. Vibration and rotational spectroscopy of diatomic molecules. Applications. Nuclear magnetic resonance and magnetic resonance imaging, surface characterization techniques. Diffraction and scattering.

Module 3: Intermolecular forces and potential energy surfaces [4L]

Ionic, dipolar and van Der Waals interactions. Equations of state of real gases and critical phenomena. Potential energy surfaces of H₃, H₂F and HCN and trajectories on these surfaces.

Module 4: Use of free energy in chemical equilibrium [6L]

Thermodynamic functions: energy, entropy and free energy. Estimations of entropy and free energies. Free energy and emf. Cell potentials, the Nernst equation and applications. Acid base, oxidation reduction and solubility equilibrium. Water chemistry. Corrosion. Use of free energy considerations in metallurgy through Ellingham diagrams.

Module 5: Periodic properties [4L]

Effective nuclear charge, penetration of orbitals, variations of s, p, d and f orbital energies of atoms in the periodic table, electronic configurations, atomic and ionic sizes, ionization energies, electron affinity and electro negativity, polarizability, oxidation states, coordination numbers and geometries, hard soft acids and bases, molecular geometries

Module 6: Stereochemistry [4L]

Representations of 3 dimensional structures, structural isomers and stereoisomers, configurations and symmetry and chirality, enantiomers, diastereomers, optical activity, absolute configurations and conformational analysis. Isomerism in transitional metal compounds

Learning Objective:

In this course, the students will develop communicative competence in English so as to make them industry-ready, with special emphasis on knowledge in grammar and English writing.

Course Outcome:

CO1: To learn how to employ communication skills in the workplace

CO2: To understand and learn about the use of the different elements of English

CO3: To develop requisite skills for effective reading and comprehension of texts

CO4: To learn how to compose formal, written communication

CO5: To enhance listening skills for effective communication.

Course Content:

Module 1: Communication in a Globalized World

[4L]

Introduction; meaning of communication; five stages of communication; formal and informal communication; verbal and non-verbal communication; role of body language in communication; barriers to effective communication; prejudice and lack of sensitivity in communication; gender/culture neutrality.

Module 2: Functional Grammar

[8L]

Articles and prepositions. Direct and indirect verbs, subject-verb agreement. Tense and voice, sentences: simple, complex and compound; direct and indirect speech..

Module 3: Reading Comprehension

[6L]

Reading purposes and skills: skimming, scanning and intensive reading, reading comprehension: fictional and non-fictional prose, one-word substitution and sentence making.

1. "Where the Mind is without Fear" by Rabindranath Tagore
2. "Out of Business" by R.K. Narayan

Module 4: Writing Skills [

6L]

Paragraph, formal letters, emails, job applications, order and complaint letter, importance of punctuation in writing.

Course Title	LIFE SKILLS				
Category					
LTP & Credits	L	T	P	Credits	
	0	0	1	1	
Total Contact Hours	30				
Pre-requisites	None				

Learning Objective:

Life skills are those competencies that provide the means for an individual to be resourceful and positive while taking on life's vicissitudes. Development of one's personality by being aware of the self, connecting with others, reflecting on the abstract and the concrete, leading and generating change, and staying rooted in time-tested values and principles is being aimed at. This course is designed to enhance the employability and maximize the potential of the students by introducing them to the principles that underlie personal and professional success, and help them acquire the skills needed to apply these principles in their lives and careers.

Course Outcomes:

After the completion of the course, the student will be able to:

- **CO1:** Define and identify different life skills required in personal and professional life.
- **CO2:** Develop an awareness of the self and apply well-defined techniques to cope with emotions and stress.
- **CO3:** Explain the basic mechanics of effective communication and demonstrate these through presentations.
- **CO4:** Take part in group discussions for goal-setting, decision-making, and problem-solving, and work effectively in teams to achieve common goals.
- **CO5:** Use appropriate thinking and problem-solving techniques to solve new problems.

Course Content:

Module 1:[6L]

Overview of Life Skills: Meaning and significance of life skills, Life skills identified by WHO: Self-awareness, Empathy, Critical thinking, Creative thinking, Decision making, Problem solving, Effective communication, Interpersonal relationships, Coping with stress, Coping with emotion.

Life Skills for Professionals: Positive thinking, Right attitude, Attention to detail, Having the big picture, Learning skills, Research skills, Perseverance, Setting goals and achieving them, Helping others, Leadership, Motivation, Self-motivation, and motivating others, Personality development, IQ, EQ, and SQ.

Module 2:[7L]

Self-awareness: Definition, need for self-awareness; Coping with stress and emotions, Human values, tools and techniques of SA: Questionnaires, journaling, reflective questions, meditation, mindfulness, psychometric tests, feedback.

Stress Management: Stress, reasons and effects, identifying stress, stress diaries, the four A's of stress management, techniques, Approaches: action-oriented, emotion-oriented, acceptance-oriented, resilience, Gratitude Training.

Coping with emotions: Identifying and managing emotions, harmful ways of dealing with emotions, PATH method and relaxation techniques.

Morals, Values, and Ethics: Integrity, Civic Virtue, Respect for others, Living peacefully, Caring, Sharing, Honesty, Courage, Valuing time, Time management, Co-operation, Commitment, Empathy, Self-confidence, Character, Spirituality, Avoiding procrastination, Sense of engineering ethics.

Module 3:[5L]

21st Century Skills: Creativity, Critical Thinking, Collaboration, Problem Solving, Decision Making, Need for Creativity in the 21st century, Imagination, Intuition, Experience, Sources of Creativity, Lateral Thinking, Myths of creativity, Critical thinking Vs Creative thinking, Functions of Left Brain & Right Brain, Convergent & Divergent Thinking, Critical reading & Multiple Intelligence.

Steps in Problem Solving: Problem Solving Techniques, Six Thinking Hats, Mind Mapping, Forced Connections, Analytical Thinking, Numeric, symbolic, and graphic reasoning. Scientific temperament and Logical thinking.

Module 4:[6L]

Group and Team Dynamics: Introduction to Groups: Composition, formation, cycle, thinking, clarifying expectations, problem solving, consensus, dynamics techniques, Group vs Team, Team dynamics, Virtual teams. Managing team performance and managing conflicts, Entrepreneurship

Case Studies: Students analyze real-world case studies to apply life skills concepts to practical problems.

Module 5:[6L]

Leadership: Leadership framework, entrepreneurial and moral leadership, vision, cultural dimensions. Growing as a leader, turnaround leadership, managing diverse stakeholders, crisis management. Types of leadership, traits, styles, VUCA leadership, levels of leadership, transactional vs. transformational leaders, leadership grid, effective leaders.

Self-Assessment Quizzes: Students complete self-assessment quizzes to reflect on their strengths, weaknesses, values, and goals.

Total Contact Hours	24			
Pre-requisites	None			

Learning Objective:

In this laboratory course, students will be exposed to the need for English in the workplace and equipped with good language skills, communication skills, and soft skills.

Course Outcome:

CO1: Apply different skills of technical communication in English.

CO2: Use correct pronunciation when speaking English.

CO3: Use appropriate techniques for effective and active listening.

CO4: Learn to express ideas clearly and coherently in professional settings.

CO5: Demonstrate effective verbal and non-verbal communication skills in various professional scenarios, including presentations, meetings, and interviews

Course Content:

Suggestive List of Experiments:

1. Learn about phonetics and pronunciation guide (Introduction of phonetics and phonetic table, tongue and lip movements for vowels and consonants, monophthongs/diphthongs, voiced/unvoiced, aspirated/unaspirated, minimal pairs, syllables, stress, and intonation). [4 Days]
2. Training on listening and comprehension (Active listening and its techniques, academic listening versus business listening, listening activities: answering questions, form filling, summarizing news bulletin, presentation, video clip, lecture, story). [6 Days]
3. Training on speaking skills (Basic parameters of speaking, fluency-focused activities: JAM, conversational role plays, speaking using a picture, group discussions, and personal interviews). [6 Days]
4. Laboratory project work (Making a 5-minute animation video with voiceover OR making a 10-minute documentary film). [8 Days]

Total Contact Hours	36			
Pre-requisites	None			

Learning Objective:

1. To prepare the students to have a basic knowledge of active and passive components.
2. To develop the ability to measure signals using a multimeter, CRO.
3. To understand the characteristics of proper biasing for BJT and FET.
4. To encourage the development of circuits using diodes, transistors, FETs, and OPAMPs.

Course Outcome:

CO1: To study and evaluate the characteristics of basic electronic components (Diode, BJT, FET).

CO2: To demonstrate the working of CRO, Function Generator, Digital Multimeter, and D.C. power supply.

CO3: To sketch the V-I characteristics of p-n junction diode, Zener diode, BJT.

CO4: To construct the rectifier circuit using diode and Inverting, Non-inverting amplifiers Circuit using Op-Amp.

CO5: To determine the characteristics parameters of Op-Amp.

Course Content:

List of Experiments:

1. Familiarization with passive and active electronic components such as Resistors, Inductors, Capacitors, Diodes, Transistors (BJT). [3 days]
2. Familiarization with measuring and testing equipment like Digital Multimeter, CRO, Signal generator, and Power Supply. [2 days]
3. Study of V-I characteristics of Junction diode. [1 day]
4. Study of V-I characteristics of Zener diode. [1 day]
5. Study of Half wave and Full wave rectifier. [2 days]
6. Study of V-I characteristics of BJT. [1 day]
7. Study of an operational amplifier chip and analyze its functionality. [2 days]
8. Design of non-inverting and inverting amplifier using operational amplifier. [2 days]
9. Design of adder, differential amplifier using operational amplifier. [2 days]
10. Verification of the truth table of basic logic gates using IC. [1 day]

11. Innovative Experiment. [1 day]

Course Code	YCS2102				
Course Title	Data Structures Laboratory				
Category	Programme Core				
LTP & Credits	L	T	P	Credits	
	0	0	3	1.5	
Total Contact Hours	36				
Pre-requisites	Fundamentals of Programming				

Learning Objective:

In this course, students will learn about implementing different algorithmic approaches in C programs using non-linear and linear data structures to solve problems in various engineering domains.

Course Outcome:

- CO1: Choose appropriate data structures for specified problem definitions.
 CO2: Compare operations such as searching, insertion, deletion, and traversing mechanisms on various data structures.
 CO3: Explain practical applications of data structures.
 CO4: Analyze how to store, manipulate, and arrange data efficiently.
 CO5: Implement various data structures using arrays and linked lists.

Course Content:

1. Experiments on Arrays [1 day]
 - Addition and Multiplication of Arrays
 - Implementation of Sparse Matrices

2. Experiments on Abstract Data Types [2 days]
 - Implementation of stack using Array
 - Applications of stack: infix to postfix conversion, expression evaluation
3. Experiments on Linked List [2 days]
 - Implementation of linked lists and its operations: insertion, deletion, and reverse
 - Implementation of stacks and queues using linked lists
 - Polynomial addition and polynomial multiplication
4. Experiments on Searching and Sorting [2 days]
 - Searching: Linear Search, Binary Search
 - Sorting: Bubble Sort, Selection Sort, Insertion Sort, Quick Sort, Merge Sort, and Heap Sort
5. Experiments on Non-linear Data Structures [2 days]
 - Traversals of binary tree, Binary Search Tree (BST), Threaded binary tree
 - Height-balanced binary tree: AVL tree (insertion, deletion)
 - B-Trees: insertion, deletion
6. Experiments on Hashing [1 day]
 - Implementation of Hash tables and its operations: searching, inserting, and deleting, handling collisions
7. Innovative Experiments [2 days]
 - Case study of solving complex problems from various engineering domains using suitable data structures (e.g., mesh analysis in electrical circuits, event-driven simulation, etc.).

	0	0	3	1.5
Total Contact Hours	36			
Pre-requisites	None/IfAny			

Learning Objective:

The learning objectives of engineering graphics typically include developing skills and knowledge related to the visualization, interpretation, and communication of engineering designs.

Course Outcomes (COs):

After attending the course, students would:

CO1: Get introduced to Engineering Graphics and visual aspects of design.

CO2: Know and use common drafting tools with the knowledge of drafting standards.

CO3: Able to apply computer-aided drafting techniques to represent line, surface, or solid models in different engineering viewpoints.

CO4: Able to produce part models; carry out assembly operations and show the working procedure of a designed project work using animation.

CO5: Demonstrate proficiency in using computer-aided design (CAD) software to create and modify engineering drawings, including 2D and 3D models, with an understanding of industry standards and practices.

Course Content:

List of Drawings:

- **Traditional Engineering Graphics:** Principles of Engineering Graphics; Orthographic Projection; Descriptive Geometry; Drawing Principles; Isometric Projection; Surface Development; Perspective; Reading a Drawing; Sectional Views; Dimensioning & Tolerances; True Length, Angle; intersection, Shortest Distance.

Modules:

Module 1: Introduction to Engineering Drawing

- Principles of Engineering Graphics and their significance.
- Usage of Drawing instruments.
- Lines, lettering, Dimensioning.
- Scales – Plain, Diagonal, and Vernier Scales.

Module 2: Geometrical Construction and Curves

- Construction of polygons, Parabola, Hyperbola, Ellipse, Cycloid, Archimedean Spiral, and Involute (square & circle).

Module 3: Projection of Points, Lines, Surfaces

- Orthographic projection - 1st and 3rd angle projection.
- Projection of lines and surfaces – Hexagon.

Module 4: Projection of Solids

- Cube, Pyramid, Prism, Cylinder, Cone.

Module 5: Drawing Isometric view from Orthogonal / Sectional views of Simple Solid Objects

- Principles of Orthographic Projections.
- Conventions.
- Projections of Points and lines inclined to both planes.
- Auxiliary Views.
- Isometric Views of lines, Planes, Simple, and compound Solids.
- Conversion of Isometric Views to Orthographic Views and Vice-versa.

Module 6: Sections and Sectional Views of Right Angular Solids

- Full and half-sectional views of solids.

Module 7: Development Of Surfaces

- Prism, Cylinder, Cone.

Module 8: Computer-Aided Drafting (Using AutoCAD and/or similar softwares)

- Introduction: Cartesian and Polar coordinate system, Absolute and Relative coordinates.
- Basic editing commands: Line, Point, Trace, Rectangle, Polygon, Circle, Arc, Ellipse, Polyline.
- Editing methods.
- Basic object selection methods, Window and crossing window, Erase, Move, Copy, Offset, Fillet, Chamfer, Trim, Extend, Mirror.
- Display commands: Zoom, Pan, Redraw, Regenerate.
- Simple dimensioning and text.
- Simple exercises.

Learning Objective:

The students will learn to estimate rate constants of reactions from concentration of reactants/products as a function of time. Measure molecular/system properties such as surface tension, viscosity, conductance of solutions, redox potentials, chloride content of water, etc. Synthesize a small drug molecule and analyze a salt sample.

Course Outcome:

- CO1:** To understand and apply basic chemical principles
CO2: To Perform experiments and analyze data
CO3: Apply chemical knowledge to engineering applications.
CO4: To Develop experimental techniques and problem-solving skills.
CO5: Understand the importance of chemical properties and reactions in various engineering fields.

Course Contents:

1. Determination of surface tension and viscosity
2. Thin layer chromatography
3. Ion exchange column for removal of hardness of water
4. Determination of chloride content of water
5. Colligative properties using freezing point depression
6. Determination of the rate constant of a reaction
7. Determination of cell constant and conductance of solutions
8. Potentiometry - determination of redox potentials and emfs
9. Chemical analysis of a salt
10. Lattice structures and packing of spheres
11. Models of potential energy surfaces
12. Chemical oscillations- Iodine clock reaction

13. Determination of the partition coefficient of a substance between two immiscible liquids
14. Adsorption of acetic acid by charcoal
15. Use of the capillary viscosimeters to demonstrate the isoelectric point as the pH of minimum viscosity for gelatin sols and/or coagulation of the white part of egg.

A large, light blue watermark of the JIS University logo is centered on the page. It consists of the letters 'JIS' in a stylized font inside a rounded rectangle, with the word 'UNIVERSITY' written in a smaller font below it.

Semester 3 Curriculum and Syllabus

UNIVERSITY

Course Code	YCS3005			
Course Title	Probability and Statistics			
Category	ENGG, Minor			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	None			

Learning Objective:

In this course, students will learn about the basic knowledge of probability and statistics. At the end of the course, the students will be able to solve different real-life problems in the field of artificial intelligence, data science, etc.

Course Outcome:

- CO1: To explain and demonstrate the distinctive characteristics of probability distribution.
- CO2: To analyze the probability of real-world uncertain phenomena by identifying probability distribution that fits the phenomena.
- CO3: To explain and demonstrate the distinctive characteristics of statistics.
- CO4: To apply and analyze the uses and limitations of statistical analysis.
- CO5: Apply probability and statistical concepts to solve problems in artificial intelligence, data science, and other relevant fields.

Course Content:

Module 1: Basic Probability: [12L]

Probability spaces, conditional probability, independence; Discrete random variables, Independent random variables, the multinomial distribution, Poisson approximation to the binomial distribution, infinite sequences of Bernoulli trials, sums of independent random variables; Expectation of Discrete Random Variables, Moments, Variance of a sum, Correlation coefficient, Chebyshev's Inequality.

Module 2: Continuous Probability Distributions: [4L]

Continuous random variables and their properties, distribution functions and densities, normal, exponential and gamma densities.

Module 3: Bivariate Distributions: [4L]

Bivariate distributions and their properties, distribution of sums and quotients, conditional densities, Bayes' rule.

Module 4: Basic Statistics: [8L]

Measures of Central tendency: Moments, skewness and Kurtosis - Probability distributions: Binomial, Poisson and Normal - evaluation of statistical parameters for these three distributions, Correlation and regression – Rank correlation.

Module 5: Applied Statistics:

[8L]

Curve fitting by the method of least squares- fitting of straight lines, second degree parabolas and more general curves. Test of significance: Large sample test for single proportion, difference of proportions, single mean, difference of means, and difference of standard deviations.

Learning Objective:

In this course, students will learn about the representation of numbers in a computer system and how digital circuits can be designed using logic gates and flip-flops. They will also learn about the process of digital-to-analog and analog-to-digital conversions. After completing this course, students will be in a better position to understand the basic operation of a computer system and how various functional blocks can be implemented.

Course Outcome:

CO1: Explain the binary number system and its importance in digital circuit design.

- CO2: Classify and analyze various ways of minimizing switching functions.
CO3: Understand the process of designing combinational logic circuits.
CO4: Understand the process of designing sequential logic circuit modules.
CO5: Understand and remember the process of analog-to-digital and digital-to-analog conversion.

Course Content:

Module 1: Number Systems and Binary Codes [5L]

- Introduction to number systems: decimal, binary, octal, hexadecimal.
- Conversion from one number system to another.
- Signed number representation: sign-magnitude, 1's complement, and 2's complement.
- Addition and subtraction of numbers.
- Binary codes: BCD, excess-3 code, gray code.
- Introduction to floating-point representation and its importance in representing real numbers in digital systems.

Module 2: Logic Families and Minimization of Switching Functions [6L]

- Logic gates and their functionalities.
- Logic families: TTL, nMOS, CMOS, pass transistor logic.
- Realization of gates.
- Boolean algebra, truth tables, and switching functions.
- Minimization of completely and incompletely specified switching functions: Karnaugh Map and Quine-McCluskey methods.
- Explanation of buffer and tri-state buffer operations and their applications in digital circuits.
- Introduction to HDL and its importance in describing digital circuits for synthesis and simulation.

Module 3: Combinational Logic Circuits [7L]

- Realization of Boolean functions using NAND/NOR gates.
- Half-adder, full-adder, and ripple-carry adder/subtractor.
- Decoders, Encoders, and Multiplexers: applications in logic design.
- Adder-Subtractor Circuits: Detailed explanation of adder-subtractor circuits and their applications in arithmetic operations.
- Comparator Circuits: Introduction to comparator circuits and their use in comparing binary numbers.

Module 4: Sequential Logic Circuits [7L]

- Clocks, flip-flops, and latches.
- Types of flip-flops: SR, D, JK, T; Edge-triggered and master-slave flip-flops.
- State table and state diagram, state minimization, synthesis of finite state machines (FSMs).

Module 5: Counters and Registers [6L]

- Synchronous and asynchronous counters, up/down counters.
- Applications of counters.
- Registers: parallel-in parallel-out and shift registers, linear feedback shift register (LFSR).
- Applications of registers in datapaths.

Module 6: D/A and A/D Conversion Techniques [5L]

- Digital-to-analog converters: principle of operation, weighted resistor and resistive ladder D/A converters.
- Analog-to-digital converters: resolution and accuracy.
- Types of A/D converters: flash type, counter type, successive-approximation type.
- Sigma-Delta ADCs: Introduction to sigma-delta analog-to-digital converters and their advantages in achieving high resolution.
- Successive Approximation Register (SAR) ADCs: Detailed explanation of successive approximation register ADCs and their operation principles.

Total Contact Hours	36				
Pre-requisites	a)Digital Circuits and Logic Design				

Learning Objective:

In this course, students will learn about the evolution of computer systems and development in computer organization and architecture. Special emphasis will be placed on the various functional units of a computer system and how instructions are executed. By the end of the course, students will have a better understanding of how programs are executed in a computer system.

Course Outcomes:

CO1: Explain the process of instruction execution.

CO2: Analyze and design the control unit of a computer system.

CO3: Analyze and design adder, multiplier, and division units.

CO4: Analyze and design memory subsystems.

CO5: Explain and classify various input/output data transfer techniques.

Course Content:

Module 1: Evolution of Computer System

[4L]

- Introduction to computing system
- Computer organization and architecture
- Basic functional units of a computer
- Evolution of computers
- Stored-program concept
- Von Neumann and Harvard models

Module 2: Basic Operation of Computer

[7L]

- Instruction Set Architecture
- CPU registers
- Instruction format and encoding
- Addressing modes
- Instruction set
- Instruction types
- Instruction decoding and execution
- Basic instruction cycle
- Reduced Instruction Set Computer (RISC)
- Complex Instruction Set Computer (CISC)
- Case study: MIPS Instruction set, MIPS assembly language programming
- Pipelining: Basic concepts, pipeline hazards, techniques to overcome hazards (e.g., forwarding, stalling, branch prediction)
- Case study: Pipeline stages and operation in a modern processor (e.g., Intel or AMD processors)

Module 3: Processor Unit Design

[7L]

- Register transfer operations

- Internal single and multi-bus architecture
- Design of control unit: hardwired control unit design, micro programmed control unit design, concept of control word and control store
- Horizontal, vertical, and diagonal micro programmed control unit design

Module 4: Arithmetic Unit Design

[6L]

- Adder and subtractor
- Shift-and-add multiplication
- Signed multiplication: Booth's algorithm, integer division, restoring and non-restoring division
- Floating-point representation: IEEE floating point format, floating-point arithmetic
- Superscalar and out-of-order execution: Concepts and advantages
- Speculative execution: Purpose and implementation in modern processors

Module 5: Memory Unit Design

[7L]

- Basic memory types: Random Access Memory (RAM), Read Only Memory (ROM), Static RAM, Dynamic RAM
- Memory hierarchy
- Cache memory: mapping techniques, memory interleaving
- Virtual memory: Concepts, benefits, implementation (e.g., page tables, TLB)
- Memory management techniques: Fragmentation, compaction, techniques to reduce fragmentation (e.g., buddy system)

Module 6: Input Output Organization

[5L]

- I/O mapped I/O and Memory mapped I/O
- Synchronous and Asynchronous serial data communication
- Secondary memory: disk, flash memory
- I/O Data transfer techniques: Programmed I/O, Interrupt-driven I/O, Direct Memory Access (DMA)

TotalContactHours	36				

Learning Objective: The course will cover topics such as algorithm complexity concepts and diverse algorithmic designs, including divide and conquer, dynamic programming, and greedy algorithms. It will also include important search and sorting algorithms, graphs, and basic approaches to optimization.

Course Outcome:

1. To understand the concepts of time and space complexity, worst case, average case, and best case complexities, and the big-O notation.
2. To apply design principles and concepts to algorithm design.
3. To understand and analyze the mathematical foundation in the analysis of algorithms.
4. To explain and classify different algorithmic design strategies.
5. To analyze the efficiency of algorithms using time and space complexity theory.

Course Content:

Module 1: Complexity Analysis

[4L]

- Time and space complexity
- Different asymptotic notations and their mathematical significance
- Solving recurrences: substitution method, recurrence tree method, Master Theorem

Module 2 Divide and Conquer**[8L]**

- Basic concept
- Examples: binary search, merge sort, quick sort and their complexity (all three cases)
- Heap sort and its complexity
- Karatsuba algorithm
- Introduction to randomized algorithms and their application in divide and conquer
- Lower Bound Theory: Comparison trees, Oracle and adversary argument, State space method

Module 3: Dynamic Programming**[10L]**

- Basic concepts
- Matrix chain manipulation
- Strassen's algorithm
- Longest common subsequence
- All-pair shortest paths (Floyd Warshall)
- Single-source shortest path (Dijkstra, Bellman-Ford)
- 0/1 Knapsack problem
- Traveling Salesman problem
- Greedy Method: Basic concept
- Examples: fractional Knapsack problem, job sequencing with deadlines
- Minimum cost spanning tree using Prim's and Kruskal's method
- Huffman encoding and decoding
- Advanced dynamic programming techniques (e.g., memoization, tabulation)
- Backtracking: Basic concept
- Examples: n-queens problem, graph coloring problem
- Disjoint Set Manipulation: Set manipulation algorithm like UNION-FIND, union by rank

Module 4: String Matching Problem**[8L]**

- Different techniques: Naive algorithm, string matching using finite automata, and Knuth, Morris, Pratt (KMP) algorithm with their complexities
- Rabin-Karp algorithm for string matching with a rolling hash function
- Boyer-Moore algorithm for string searching with a heuristic to skip comparisons
- Amortized Analysis and Network Flow: Aggregate, Accounting, and Potential Method
- Ford Fulkerson algorithm
- Max-Flow Min-Cut

Module 5: Notion of NP-Completeness**[6L]**

- NP class, NP-hard class, NP-complete class, their interrelationship
- Reductions and Polynomial time Reducibility
- Satisfiability problem (3-SAT and 2-SAT)
- Cook-Levin's theorem
- Clique decision problem
- Vertex Cover problem
- Additional small important topics in existing modules

Learning Objective:

The course is explained the principles of systems biology and the central dogma of molecular biology. Explore various biological databases and understand their structure, including sequence and gene expression data. This course analyze biological sequences through alignment and similarity measures by applying dynamic programming and heuristic algorithms for sequence alignment. Use Hidden Markov Models (HMM) for pair wise alignment and motif discovery

Course Outcome:

CO1: Explain key concepts of cell biology, systems biology, and the central dogma, along with the role of biological databases in bioinformatics.

CO2: Retrieve and interpret biological sequence and expression data from major public databases such as NCBI and assess the challenges of biological data integration.

CO3: Apply sequence alignment techniques including dynamic programming, heuristic methods, and Hidden Markov Models to analyze genetic sequences.

CO4: Construct and evaluate phylogenetic trees and perform motif discovery using computational methods.

CO5: Implement clustering and classification algorithms to analyze biological data, and interpret the results in the context of biological information systems.

Course Content:

Module 1: Cell Biology [10L]

System Biology, Central Dogma, Biological Database: Sequence data, Gene expression data, Micro-array experiment, NCBI database, Challenges faced in the integration of biological data, Data management and data integration in bio-informatics, Issues related to the designing of a biological information system.

Module2: Sequence similarity, homology, and alignment. Pair wise alignment [14L]

Scoring model, dynamic Programming algorithms, heuristic alignment, and pair wise alignment using Hidden Markov models (HMM), multiple alignment: scoring model, local alignment gapped and ungapped global alignment. Motif finding: motif models, finding occurrence of known sites, discovering new sites, Amino Acid, Protein, Phylogenetic tree construction: Neighbor Joining Algorithm.

Module 3: Clustering algorithms: [12]

K-means, k-medoid, Isodata, AGNES, DIANA, BIRCH, DBSCAN, CHAMELON, Grid based methods, Model based methods Classifier: Bayes theorem, Naïve Bayes classifier, Bayesian belief network,

Learning Objective:

In this laboratory course, students will conduct hands-on sessions for the design and implementation of combinational and sequential digital circuit modules, as well as interfacing LED and 7-segment display units.

Course Outcome:

- CO1: To understand and test the functionalities of basic gates.
- CO2: To understand Boolean functions using various combinational circuit modules (like gates, multiplexer, decoder, etc.).
- CO3: To understand and verify the functions of flip-flops and other sequential circuit elements (like counter, register, etc.).
- CO4: To understand and analyze complex digital systems and verify the functionality.
- CO5: To design a data path consisting of an ALU, registers, and multiplexers, and then design the control path to compute the Greatest Common Divisor (GCD) of two numbers.

Course Content:

1. Design a basic inverter using transistors, obtain the transfer characteristics, and measure the propagation delay. Repeat the experiment using an inverter chip.
2. Given a Boolean function, minimize it and realize the function using NAND gates. Using a 555 timer, design a rectangular waveform generator of a given frequency.
3. Design a full-adder using basic gates. Cascade two such full-adders to realize a 2-bit adder. Connect LEDs to observe the outputs and verify the functionality.
4. Verify the functionality of multiplexer and decoder chips. Implement a 4-variable Boolean function using an 8-to-1 multiplexer.
5. Implement RS and JK master-slave flip-flops using NAND gates and verify their functionalities. Verify the functionality of a J-K flip-flop chip.
6. Using JK or D flip-flops, design a 4-bit shift register and verify the functionality. Modify the designs to make it into (a) a ring counter, (b) Johnson counter and verify the functionality.
7. Design a 3-bit synchronous counter that counts in some arbitrary count sequence. Apply a square wave at the clock input and analyze the waveforms observed.
8. Design a 2-digit BCD counter and display the count value on 7-segment display units.
9. Design an 8-bit modulo-N counter for some arbitrary value of N. Connect a D/A converter at the output of the counter and observe the output waveform. Analyze the operation for various values of N. Use the circuit to display the transfer characteristic of a NOT gate on the oscilloscope.
10. Design a data path consisting of an ALU, registers, and multiplexers. Hence design the control path to compute the GCD of two numbers.

Pre-requisites	None
----------------	------

Learning Objective:

The purpose of this course is to learn and practice basic programming concepts, skills needed for basic problem solving, and applications—plots and built-in statistical and set operations, all using MATLAB as the vehicle. MATLAB is a powerful software package that has built-in functions to accomplish a diverse range of tasks, from mathematical operations to three-dimensional imaging. Additionally, MATLAB has a complete set of programming constructs that allow users to customize programs to their own specifications.

Course Outcome:

CO1: To impart knowledge to the students using MATLAB software that enhances programming knowledge in Research and Development.

CO2: To introduce the MATLAB technical computing environment for the analysis and visualization of data to understand and predict future scenarios.

CO3: To introduce students to the use of a high-level programming language, MATLAB, for solving scientific and engineering problems.

CO4: Reinforce a structured, top-down approach to formulate and solve problems.

CO5: Introduce common approaches, structures, and conventions for creating and evaluating computer programs, primarily in a procedural paradigm.

Course Content:

1. Basic Commands:

- Clear Command: Removes all variables from the workspace.
- Clc Command: Clears the command window and homes the cursor.
- Help Command: Displays help about a topic if it exists.
- Lookfor Command: Provides help by searching through all the first lines of MATLAB help topics and returning those that contain a keyword you specify.
- Edit Command: Enables you to edit (open) any M-file in the Editor Window. This command does not open built-in functions like sqrt. See also the type Command.
- More command: More on enables paging of the output in the MATLAB command window, and more off disables paging of the output in the MATLAB command window.

2. Create/Initialize Matrix:

- Separate the elements of a row with blanks or commas, use semicolons to indicate the end of each row, and surround the entire list of elements with square brackets.

3. Matrix Operations:

- Display the result of addition, subtraction, and multiplication operations on matrices.

4. Colon Operator:

- Create and display vectors using the colon operator along with spacing, perform possible arithmetic operations, and validate the result.

5. Zero and Unit Matrix:

- Create and display zero and unit matrices of the required size.

6. Matrix Manipulations:

- Find and display the inverse and transpose of a given matrix, find the largest element in each vector of the matrix, and store it at n+1 positions of each row or vector. Also, find the maximum element of the matrix at n+1, m+1 positions, where n and m are the sizes of the given matrix.

7. Display Results of Various Commands/Functions:

- Diag(), prod(), median(), sort(), det(), tril(), and triu().

8. Built-in Functions:

- Write a program to display the result of various built-in functions like abs(), atan(), ceil(), log(), rem(), sqrt(), rand(), randn(), and mod().

9. Plotting:

- Plot a graph of y versus x, where x values range from zero to 2π , and y values are the sine of x.

10. Graph Labeling:

- Display the graph with proper labeling using xlabel, ylabel, and title commands.

11. Plotting Sinc Function:

- Plot the Sinc function, where $\text{Sinc}(x) = \sin(x) / x$, and $-2\pi \leq x \leq 2\pi$.

12. M-File Program:

- Write a program in an M-File to read a 3x3 Matrix, then display the diagonal of the matrix.

13. String Manipulation:

- Write a program to read a string, then replace each character in the string with its following character in ASCII code.

14. Control Structures:

- Programs using control structure statements. For example, display all prime numbers between two given input values.

15. Image Processing:

- Write a program to read an image and display the resulting image of the following commands: imresize() and imhist().

Pre-requisites	a)Digital Circuits Laboratory			

Learning Objective:

In this laboratory course, students will conduct experiments using a MIPS instruction set simulator. They will also learn how to model various hardware blocks using the hardware description language Verilog. They shall be designing various functional units like adder, multiplier, processor, etc., using Verilog.

Course Outcome:

1. CO1: To understand how to write assembly language programs in MIPS.
2. CO2: To design various combinational and sequential circuits using Verilog.
3. CO3: To design and analyze various CPU functional units using Verilog.
4. CO4: To apply a pipelined processor using Verilog.
5. CO5: To implement and simulate the MIPS 5-stage pipeline in Verilog, utilizing a subset of 16 instructions, and validate the design by composing a comprehensive test bench with sample machine language programs stored in a memory module.

Course Content:

1. Familiarization with MIPS assembly language programming using an instruction set simulator like QtSPIM.
 - Reading and displaying an arbitrary string and an integer.
 - Storing numbers sequentially in memory and finding the minimum, maximum, and sum.
 - Sorting a set of numbers stored in memory. [2 days]
2. Familiarization of function calls with MIPS assembly language programming.
 - Writing a function to compute the factorial of a given number.
 - Writing a function to compute the GCD of two numbers.
 - Writing a function to compute the N-th Fibonacci number. [2 days]
3. Familiarization with a Verilog simulator like iVerilog and writing simple combinational and sequential modules using behavioral and structural modeling with Verilog.
 - Writing a module to implement an arbitrary Boolean function (e.g., $F=A'BC+C'D$).
 - Writing a module to implement a full adder and hence a 4-bit ripple carry adder.
 - Writing a module to implement a D flip-flop and hence a 4-bit shift register.
 - Writing a module to implement an 8-bit up-down counter with asynchronous clear. [2 days]
4. Writing Verilog modules to implement functional blocks used in computer organization.
 - Writing a module to implement a 16-bit arithmetic and logic unit with 8 functions.
 - Writing a module to implement read/write operations in a 1024x16 memory system. [2 days]
5. Implementing the MIPS 5-stage pipeline in Verilog, using a subset of 16 instructions. The design has to be tested by writing a test bench containing sample machine language programs stored in a memory module. [4 days]

Pre-requisites	a)ProgrammingPractices I			

Learning Objective:

The course aims to provide strategies (divide and conquer, dynamic programming, greedy method) to solve problems in computer science effectively. Using these paradigms, the course will demonstrate innovative and effective approaches to solving specific problems. Rigorous proof of algorithm validity will be emphasized.

Course Outcome:

CO1: To prove the correctness and analyze the running time of basic algorithms.

CO2: To design algorithms using dynamic programming, greedy method, backtracking, branch and bound strategy, and to describe algorithms that employ these strategies.

CO3: To compare, contrast, and choose appropriate algorithmic design techniques to present an algorithm that solves a given problem.

CO4: To identify and analyze criteria and specifications appropriate to new problems.

CO5: To apply algorithmic design techniques to solve real-world scheduling and routing problems, demonstrating proficiency in graph coloring, backtracking, and optimization approaches.

Course Content:

1. Experiments on Divide and Conquer Approach:

- Binary Search (Recursive & Iterative)
- Merge Sort, Heap Sort, Quick Sort
- Find Maximum and Minimum element from an array of integers Duration: 2 days

2. Experiments on Dynamic Programming:

- Minimum number of scalar multiplications needed for chain of matrix
- All pair of shortest paths for a graph
- Single-source shortest path for a graph (Dijkstra, Bellman-Ford)
- Longest common subsequence problem Duration: 2 days

3. Experiments on Backtracking:

- The n-Queens problem
- Graph Coloring problem Duration: 2 days

4. Experiments on Greedy Methods:

- Knapsack problem
- Job sequencing with deadlines
- Minimum cost spanning tree by Prim's and Kruskal's algorithm Duration: 2 days

5. Innovative Experiments:

- Take the university timetable for all departments. Write a computer program to find all conflicts within the timetable using graph coloring approach. Provide a solution using Backtracking. Compute the distance and find the stoppages every classmate of yours cover to reach the institute. Then assume their speeds based on their travelling modes. Compute each student's minimum time to reach the institute premises. Duration: 2 days

A large, light blue watermark of the JIS University logo is centered on the page. It consists of a rounded rectangle containing the letters 'JIS' in a stylized font, with a small circle above the 'I'. Below the rectangle, the word 'UNIVERSITY' is written in a light blue, sans-serif font, flanked by two horizontal lines.

Semester 4 Curriculum and Syllabus

UNIVERSITY

Course Code	YCS4005			
Course Title	Discrete Mathematics			
Category	ENGG, Minor			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	None			

Learning Objective:

In this course, the students will learn about the mathematical foundations of computer science. The specific topics that would be covered include propositional calculus and proof techniques, set theory and other derived algebraic structures, recurrence relations, and the theory of graphs. The course will be very helpful for the students as it acts as a prerequisite for various next-level courses like algorithms, automata theory, artificial intelligence, etc.

Course Outcome:

CO1: To explain the distinctive characteristics of propositional logic and its applications.

CO2: To demonstrate the applications of various proof techniques.

CO3: To explain the basic concepts of sets, relations, functions, and various algebraic structures. CO4: To understand the concept of recurrence relations and methods of solution.

CO5: To explain and analyze the concept of graphs and various graph algorithms.

Course Content:

Module 1: Propositional Logic

[6L]

- Introduction to Propositional Calculus: Propositions, Logical Connectives, Conjunction, Disjunction, Negation.
- Conditional Connectives, Implication, Converse, Contrapositive, Inverse, Bi-conditional statements, Logical Equivalence, Tautology.
- Conjunctive and disjunctive normal forms.
- Universal and existential quantifiers and their negations.

Module 2: Proof Techniques

[6L]

- Forward proof, proof by contradiction, contrapositive proofs, proof by mathematical induction, proof of necessity and sufficiency.
- Weak Induction and Strong Induction.

Module 3: Sets, Relations and Functions

[8L]

- Operations on sets, relations and functions, binary relations, partial ordering relations, equivalence relations.
- Finite and infinite set, countable and uncountable sets.
- Algebraic structures with one binary operation: semigroups, monoids, and groups.
- Algebraic structures with two binary operations: rings and fields.
- Power Sets, Cardinality of Finite and Infinite Sets.

Module 4: Recurrence Relations

[6L]

- Recurrence relations: Formulation of different counting problems in terms of recurrence relations.
- Solution of recurrence relations with constant coefficients by (i) iterative method, (ii) characteristic roots method, (iii) generating functions method.

- Pigeonhole principle.

Module 5: Introduction to Graphs

[10L]

- Graphs and their basic properties: digraphs, weighted graph, connected and disconnected graph, bipartite graph, complement of a graph, regular graph, complete graph, walk, path, circuit, Euler graph, cutset, cutvertices, adjacency and incidence matrices of a graph, isomorphism.
- Graph coloring problem, planar graphs, trees.
- Hamiltonian Graphs, Dijkstra's Algorithm.

Course Code	YCS4001			
Course Title	Operating Systems			
Category	ENGG, Major			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	Data Structures and Algorithms Computer Organization and Architecture			

Learning Objective:

In this course, students will learn about the role of an operating system as the interface between application programs and computer hardware. They will understand how the operating system manages various computer resources, which is essential for handling large software projects effectively.

Course Outcomes:

- CO1: To explain the role of an operating system and how it acts as an interface between hardware and software.
- CO2: To contrast the concepts of processes and threads, and how they are scheduled.

CO3: To demonstrate the use of various synchronization tools in solving the critical section problem.
CO4: To explain and classify various memory management techniques, including virtual memory.
CO5: To apply the knowledge of data structures to explain how file systems can be implemented on secondary storage.

Course Content:

Module 1: Introduction to Operating Systems

[4L]

- Functionalities of an operating system – hardware/software interface.
- Evolution of operating systems – batch, multi-programmed, time-sharing, real-time, distributed.
- Simultaneous Peripheral Operations On-Line (SPOOL).
- Protection and Security – user/supervisory mode, privileged instructions, system calls (invoking OS services).

Module 2: Processes and Threads

[7L]

- Processes – basic concept, process control block (PCB), process state transition diagram.
- Process scheduling – independent and cooperating processes, inter-process communication using shared memory and message passing. Case studies from Unix/Linux.
- Threads – lightweight process concept, benefits of threads, user and kernel-level threads, using thread library in Unix/Linux.
- CPU Scheduling – scheduling criteria, preemptive and non-preemptive scheduling. Scheduling algorithms – FCFS, SJF, SRTF, RR, priority, multi-level feedback queue.

Module 3: Process Synchronization and Deadlocks

[7L]

- Classical problems of process synchronization – producer-consumer, reader-writer, dining philosopher, etc.
- Critical section problem – illustration, software solutions, solution using synchronization hardware: test-and-set (TST) and SWAP instructions.
- Semaphores – definition, binary and counting semaphores, implementation of semaphores, minimizing busy waiting. Case studies from Unix/Linux.
- Deadlocks – deadlock characterization, methods of handling deadlock, deadlock prevention versus deadlock avoidance, Banker's algorithm.

Module 4: Memory Management

[8L]

- Logical versus physical address space, swapping, contiguous memory allocation, memory protection using fence registers.
- Paging – basic concept, performance analysis, translation look-aside buffer (TLB). Segmentation.
- Virtual memory – separation of logical and physical address space, demand paging, locality of reference. Page replacement algorithms – FCFS, LRU, Optimal, Belady's anomaly. Thrashing, working set model.
- Page table structure and its optimization techniques. Segmentation with paging (combined scheme). Memory protection and access control mechanisms. Shared memory and memory-mapped files.
- Case studies on memory management in modern operating systems (e.g., Windows, macOS, Linux).

Module 5: Device and File Management

[7L]

- Disk structure – cylinders, tracks, and sectors.
- Disk scheduling algorithms – FCFS, SSTF, SCAN, C-SCAN, LOOK, C-LOOK.
- File system – file concept, access methods, directory and file system structure, allocation methods (contiguous, linked, indexed), free space management. Case study for Unix/Linux.
- Disk management optimizations (e.g., track skewing, clustering, buffering), RAID levels and their implications for performance and fault tolerance.
- File system reliability and recovery mechanisms (e.g., journaling, shadowing), Network file systems and distributed file systems (e.g., NFS, AFS, CIFS).
- Case studies on file systems used in cloud computing and distributed systems.

Module 6: Miscellaneous Topics

[3L]

- Brief overview of real-time and distributed operating systems, mobile operating systems.

Course Code	YCS4002			
Course Title	Formal Language and Automata Theory			
Category	ENGG, Major			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	a) Discrete Mathematics b) Programming and Data Structure			

Learning Objective:

In this course, students will learn the theory of computation, including formal language classes and their relationships, techniques to prove or disprove theorems in automata theory using its properties, and approaches to determine the decidability and intractability of computational problems. At the end of the course, students will be able to analyze complex problems and automata to find solutions.

Course Outcome:

CO1: Explain the basic properties of formal languages and grammars.

CO2: Understand the tools for recognizing different formal languages.

CO3: Differentiate between regular, context-free, and recursively enumerable languages.

CO4: Apply the theory of computation and computational models, including decidability and intractability.

CO5: Analyze complex problems and automata to find solutions using the theory of computation and computational models, including decidability and intractability.

Course Content:

Module 1: Introduction to Finite Automata [10L]

- Finite Automata, Alphabets, Strings, Languages
- Regular Languages, Deterministic Finite Automata (DFA)
- Nondeterministic Finite Automata (NFA)
- Equivalence of NFA and DFA
- Minimization of Finite Automata
- Myhill-Nerode Theorem
- FA with output: Moore and Mealy machine

Module 2: Properties of Regular Expression [7L]

- Operators of regular expression and their precedence
- Algebraic laws for Regular expressions
- Kleen's Theorem
- Regular expression to FA
- Non-Regular Languages
- Pumping Lemma for regular Languages

Module 3: Language & Grammar Formalism [9L]

- Grammars, Regular grammars
- Context-Free Grammar
- Derivation, Derivation trees
- Ambiguity in Grammar
- Simplification of CFGs
- Normal forms for CFGs - CNF and GNF

Module 4: Push Down Automata

[4L]

- PDA Description and definition
- Acceptance by Final state, Acceptance by empty stack
- Deterministic PDA
- Equivalence of PDA and CFG

Module 5: Turing Machines and Decidability

[6L]

- Basic model, Definition and representation
- Language acceptance by TM
- Church's Thesis
- Recursive and recursively enumerable languages
- Halting problem
- Introduction to Undecidability

Course Title	Object Oriented Programming using Java			
Category	ENGG, Minor			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	a) Fundamentals of Programming b) Object Oriented Programming			

Learning Objective:

The course aims to provide a comprehensive understanding of Java programming with a focus on object-oriented concepts. Students will learn the fundamentals of Java, including data types, variables, control statements, and arrays. They will also gain knowledge of OOP principles such as encapsulation, inheritance, polymorphism, and abstraction. Additionally, the course covers advanced topics like exception handling, multithreading, and GUI programming in Java.

Course Outcome:

CO1: Explain the process of interaction between objects, classes, and methods.

CO2: Acquire a basic knowledge of Object Orientation with different properties.

CO3: Analyze various string handling functions with various I/O operations.

CO4: Discuss basic code reusability features with respect to Inheritance, package, and Interface.

CO5: Implement Exception handling, Multithreading, and Applet (Web program in Java) programming concepts in Java.

Course Content:

Module 1: Java Basics

[8L]

- JVM architecture
- Data types, variables, and operators
- Control statements

- Arrays
- Exception handling
- Java Collections Framework (List, Set, Map, Array List, Linked List, Hash Set, Hash Map)

Module 2: Object-Oriented Programming

[7L]

- Encapsulation
- Class fundamentals
- Object & Object reference
- Constructors
- Access control
- Nested methods
- Abstract Class & Interfaces
- Enumerations
- Packages
- Reflection

Module 3: Inheritance and Polymorphism

[9L]

- Types of inheritance
- Member access rules
- Usage of this and Super keyword
- Method Overloading and Overriding
- Abstract classes
- Dynamic method dispatch
- Packages and Interfaces
- I/O Streams

Module 4: Exception Handling and Multithreading

[6L]

- Exception types
- Try, Catch, Throw, Throws, Finally
- Thread basics

- Thread Life-Cycle
- Synchronizing Threads
- Inter Communication of Threads
- Critical Factor in Thread
- Deadlock

Module 5: GUI Programming and Applet

[6L]

- Applet vs. Application
- Applet Lifecycle
- GUI Programming basics
- AWT Components
- Swing Components
- Java Utilities (java.util Package)

TotalContactHours	24
Pre-requisites	None

Learning Objective:

In this course, students will learn about the fundamental principles of management used in the industry and different organizations. They will study various fields of management and related theories, applying them practically to enhance their management skills. By the end of the course, students will understand and interpret the knowledge and skills necessary to work as effective managers.

Course Outcomes:

CO1: To familiarize students with the origins of management principles and compare them with modern trends in management theories.

CO2: To understand the essential functions of management along with theories framed by management experts in the business field.

CO3: To explain the managerial process and related functions that facilitate change.

CO4: To understand the relationship between various levels of management in a business organization and the process of achieving objectives.

CO5: To explain the importance of feedback control in the management process, along with relevant theories, and to apply proper management principles in modern business practices to solve problems.

Course Content:

Module 1: Management

[4L]

- Definition, Nature, Importance, and Evolution of Management
- Contributions of Fayol, Taylor, Hawthorne, Maslow
- Management as an Art or Science?
- Functions of a Manager (Duties and Responsibilities)
- Ethics in Management

Module 2: Planning and Control

[4L]

- Planning (Steps, Types, and Barriers)
- McKinsey Approach, SWOT Analysis
- Operational and Strategic Planning
- Controlling (Concept, Relationship with Planning, Process, Dimensions)
- Management by Objectives (MBO)

Module 3: Decision Making and Organizing

[4L]

- Decision Making Process
- Certainty and Uncertainty in Decisions
- Brainstorming
- Process of Organizing
- Authority and Responsibility

- Delegation and Empowerment
- Centralization and Decentralization
- Departmentation

Module 4: Staffing

[4L]

- Manpower Planning
- Job Design
- Selection and Recruitment
- Training and Development
- Performance Appraisal

Module 5: Leadership and Communication

[3L]

- Role of Leadership
- Theories of Leadership
- Qualities of a Good Leader
- Development of Leadership
- Communication Process and Types
- Electronic Media

Module 6: Group Dynamics

[2L]

- Group Concept
- Stages of Group Formation
- Types of Groups

Module 7: Recent Trends in Management

[3L]

- Social Responsibility in Management
- Changes in Management
- Total Quality Management (TQM)
- Stress Management
- International and Global Management
- Crisis Management

Pre-requisites	Data Structures and Algorithms Computer Organization and Architecture			

Learning Objective:

In this laboratory course, students will carry out various software assignments on Unix/Linux shell programming and system calls. Additionally, assignments for simulating important OS modules like CPU scheduling, file system, etc., shall be carried out.

Course Outcome:

CO1: To learn how to write shell scripts.

CO2: To learn how to use Unix/Linux system calls and to design a shell program.

CO3: To analyze the performance of CPU scheduling algorithms through simulation.

CO4: To learn how to use multi-threaded programming.

CO5: To design and implement one OS module like memory management, file system, etc.

Course Content:

Suggestive List of Experiments:

1. Write shell scripts using "bash" shell scripting language for simple system administration tasks, text search and replacement, directory and file manipulation, simple numeric computations, etc.
2. Write programs in C for familiarization with the Unix/Linux system calls fork, exec, wait, exit, dup, pipe, shared memory, etc.
3. Write a command-line interpreter (shell) program using the Unix/Linux system calls with the facilities for: (a) running executable programs, (b) running a program in the background, (c) input and output redirection, (d) command piping.
4. Implementation of various CPU scheduling algorithms in C and compare their performances.
5. Write programs using the "pthread" library with multiple threads and use semaphores for mutual exclusion.
6. Design and implement a Unix-like memory-resident file system using the concept of inodes. OR

Implementation of memory management system supporting virtual memory, and analyze the performance.

Category	ENGG, Minor				
LTP & Credits	L	T	P	Credits	
	0	0	3	1.5	
Total Contact Hours	36				
Pre-requisites	C programming				

Learning Objective:

- To provide an overview of numerical techniques applicable to engineering problems.
- To offer insight into the implementation of these techniques.
- To build confidence in tackling numerical solutions.
- To understand the underlying physics behind numerical methods.
- To aid in method selection by understanding how methods work and their limitations.

Course Outcomes:

CO1: Demonstrate proficiency in using computer programming tools for engineering calculations.
 CO2: Construct simple computer algorithms using a programming tool.
 CO3: Apply simple numerical methods to solve engineering-related mathematical problems.
 CO4: Appreciate the limitations and applicability of numerical methods.
 CO5: Utilize computer-based numerical methods for solving engineering problems.

Course Content:

Module 1: Solution for Systems of Non-linear Equations

- Roots of non-linear equations using Bisection Method.
- Roots of non-linear equations using Regula Falsi or False Position Method.
- Roots of non-linear equations using Newton-Raphson Method.

Module 2: Solution for Systems of Linear Algebraic Equations

- System of linear equations using Gauss-Elimination Method.
- System of linear equations using Gauss-Seidal Iteration Method.
- System of linear equations using Gauss-Jordan Method.

Module 3: Numerical Integration

- Numerical integration using Trapezoidal Rule.
- Numerical integration using Simpson's Rules.

Module 4: Solution of Interpolation Polynomial

- Solution using Newton Forward Difference Interpolation Polynomial Function.
- Solution using Newton Backward Difference Interpolation Polynomial Function.
- Solution using Lagrange's Interpolation Polynomial Function.

Module 5: Numerical Solution of Ordinary Differential Equations

- Numerical solution of ordinary differential equations by Euler's Method.
- Numerical solution of ordinary differential equations by Runge-Kutta Method of 4th Order.
- Numerical solution of ordinary differential equations by Taylor Series Method.

Pre-requisites	a)Programming Practices I				

Learning Objective:

The learning objective of this course is to provide students with practical experience in implementing

object-oriented programming concepts using Java. Through hands-on exercises and projects, students will learn to design and develop Java applications using classes, inheritance, interfaces, packages, exception handling, file handling, multithreading, and event-driven programming. The course aims to enhance students' understanding and proficiency in Java programming, enabling them to solve real-world problems using object-oriented principles.

Course Outcome:

CO1: Implement and demonstrate an understanding of basic object-oriented programming principles such as classes, objects, inheritance, and polymorphism in Java.

CO2: Design and develop Java applications using interfaces, packages, exception handling, and file handling to solve programming problems.

CO3: Develop multithreaded Java applications to achieve concurrent execution of tasks and improve program efficiency.

CO4: Apply event-driven programming concepts in Java to create interactive graphical user interfaces (GUIs) for applications.

CO5: Work on a mini project that integrates various Java programming concepts learned throughout the course to solve a real-world problem.

Course Content:

1. Electricity Bill Generation using Classes [1 day]
2. Currency Converter, Distance Converter, and Time Converter Implementation using Packages [1 day]
3. Pay Slip Generation using Inheritance [1 day]
4. Stack ADT Implementation using Multiple Inheritance (Interface) [1 day]
5. String Operations using ArrayList [1 day]
6. Abstract Class Implementation [1 day]
7. User-Defined Exception Handling Implementation [1 day]
8. File Handling [1 day]
9. Multithreading Implementation [1 day]
10. Generic Function Implementation [1 day]
11. Calculator Design Using Event-Driven Programming [1 day]
12. Mini Project [1 day]

Course Code	YCS4104			
Course Title	Programming Using Python Laboratory			
Category	ENGG, Major			
LTP & Credits	L	T	P	Credits
	0	0	3	1.5
Total Contact Hours	36			
Pre-requisites	Fundamentals of Programming Basic Problem Solving			

Learning Objective:

In this practical course, students will learn Python programming basics and paradigms, including looping, control statements, and string manipulations. They will become familiar with various modules, packages, and Python libraries used for various applications, such as machine learning and deep learning.

Course Outcome:

CO1: Understand and explain the basic principles of Python programming language and object-oriented concepts.

CO2: Define and demonstrate the use of built-in data structures along with the help of condition checking and looping structures.

CO3: Understand and apply various applications of different modules and packages in Python.

CO4: Learn to handle exceptions and files in Python.

CO5: Apply Python programming concepts to develop a computer game for teaching data structures like stacks and queues, enhancing visualization and understanding of abstract concepts through game-based learning.

Course Content:

- History, Features, setting up path, working with Python, Basic Syntax, Variable and Data Types, Operator. [1 day]
- Conditional Statements: If, If-else, Nested if-else, Looping, For, While, Nested loops, Control Statements: Break, Continue, Pass. [1 day]

3. String Manipulation: Accessing Strings, Basic Operations, String slices, Function and Methods. Lists: Introduction, accessing list, Operations, Working with lists, Function and Methods. [2 days]
4. Tuple: Introduction, accessing tuples, Operations, Working, Functions, and Methods. Dictionaries: Introduction, accessing values in dictionaries, Working with dictionaries, Properties. [2 days]
5. Functions: Defining a function, Calling a function, Types of functions, Function Arguments, Anonymous functions, Global and local variables. [1 day]
6. Modules: Importing module, Math module, Random module, Packages, Composition, Input-Output Printing on screen, reading data from the keyboard, Opening and closing file, Reading and writing files, Functions. [2 days]
7. Exception and File Handling: Exception, Exception Handling, except clause, Try & finally clause, User-Defined Exceptions. [1 day]
8. Case study on using a computer game for teaching data structures on stacks and queues. The computer game is developed to help students visualize the data structures and data access operations on stacks and queues. This game-based learning is engaging, fun, and, more importantly, abstract concepts in data structures can be visualized and learned through game-playing. [2 days]

Semester 5 Curriculum and Syllabus

UNIVERSITY

Course Title	Artificial Intelligence			
Category	ENGG, Major			
LTP& Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	a)Design and Analysis of Algorithms			

Learning Objective:

In this course, students will learn the basic concepts, theories, and techniques of artificial intelligence, enabling them to understand and apply AI algorithms in various fields of Computer Engineering.

Course Outcome:

CO1: Explain the basic concept of Artificial Intelligence and its applications.

CO2: Classify and analyze various AI tools and techniques.

CO3: Learn and evaluate various AI algorithms.

CO4: Apply the basic understanding of artificial intelligence in real-world applications.

CO5: Evaluate and assess the performance, effectiveness, and ethical implications of artificial intelligence systems in various real-world applications.

Course Content:

Course Content:

Module 1: Introduction to Artificial Intelligence (AI)

[7L]

Overview: Foundations, scope, problems, and approaches of AI. Intelligent agents: reactive, deliberative, goal-driven, utility-driven, and learning agents.

Module 2: AI Techniques

[7L]

Artificial Intelligence programming techniques, Problem-solving through Search: forward and backward, state-space, blind, heuristic, problem-reduction, A*, AO*, min-max, constraint propagation, neural, stochastic, and evolutionary search algorithms, sample applications.

Module 3: Planning and Representation in AI

[8L]

Planning: planning as search, partial order planning, construction and use of planning graphs. Representing and Reasoning with Uncertain Knowledge: probability, connection to logic, independence, Bayes rule, Bayesian networks, probabilistic inference, sample applications.

Module 4: Decision Making

[8L]

Decision-Making: basics of utility theory, decision theory, sequential decision problems, elementary game theory, sample applications.

Module 5: Knowledge Acquisition

[6L]

Machine Learning and Knowledge Acquisition: learning from memorization, examples, explanation, and exploration. Learning nearest neighbor, naive Bayes, and decision tree classifiers, Q-learning for learning action policies, applications.

Course Code	YCS5002			
Course Title	Database Management System			
Category	ENGG, Major			
LTP& Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	a)Data Structures and Algorithms			

Learning Objective:

In this course, students will learn about data models, conceptualize and depict a database system, design systems using E-R diagrams, learn SQL and relational database design, understand internal storage structures using different file and indexing techniques, and grasp the concepts of transaction processing, concurrency control techniques, and recovery procedures.

Course Outcome:

- CO1: Apply E-R diagrams for an application.
CO2: Explain the creation of the normalized relational database model.
CO3: Analyze real-world queries to generate reports.
CO4: Determine whether a transaction satisfies the ACID properties.
CO5: Create and maintain an organization's database.

Course Content:

Module 1: Introduction

[3L]

- Concept and overview of DBMS, data models.
- Database languages, database administrator, database users.
- Three-schema architecture of DBMS.

Module 2: Entity-Relationship and Relational Database Model

[9L]

- Basic concepts, design issues.
- Mapping constraints, keys, entity-relationship diagram.
- Weak entity sets, extended E-R features.
- Case study on E-R model.
- Structure of relational databases, relational algebra.
- Relational calculus, extended relational algebra operations.
- Views, modifications of the database.

Module 3: SQL and Integrity Constraints

[6L]

- Concept of DDL, DML, DCL.
- Basic structure, set operations, aggregate functions.
- Null values, domain constraints, referential integrity constraints.
- Assertions, views, nested sub-queries.
- Database security application development using SQL, stored procedures, and triggers.

Module 4: Relational Database Design

[6L]

- Functional dependency, different anomalies in designing a database.
- Normalization using functional dependencies, decomposition, Boyce-Codd Normal Form, 3NF.
- Normalization using multi-valued dependencies, 4NF, 5NF.
- Case study.

Module 5: Internals of RDBMS

[6L]

- Physical data structures.
- Query optimization: join algorithm, statistics, and cost-based optimization.
- Transaction processing, concurrency control, and recovery management.
- Transaction model properties, state serializability.
- Lock-based protocols, two-phase locking, deadlock handling.

Module 6: File Organization & Index Structures

[6L]

- File and record concept, placing file records on disk.
- Fixed and variable-sized records.
- Types of single-level index (primary, secondary, clustering).
- Multilevel indices, dynamic multilevel indices using B-tree and B+ tree.

Course Code	YCS5005			
Course Title	Introduction to Data Science			
Category	ENGG, Major			
LTP& Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	a) Design and Analysis of Algorithms			

Learning Objective:

In this course, students will learn about the fundamental concepts of data science, with a detailed understanding of the data operations. Various simple statistical models and the basics of machine learning techniques of regression shall be discussed, providing students with basics of the supervised learning

Course Outcome:

- CO1: Describe what Data Science is and the skill sets needed to be a data scientist
- CO2: Explain the significance of exploratory data analysis (EDA) in data science
- CO3: Ability to learn the supervised learning, SVM
- CO4: Apply basic machine learning algorithms (Linear Regression)
- CO5: Explore the Networks, PageRank.

Course Content:

Module 1: Introduction

[7L]

Introduction, Toolboxes: Python, fundamental libraries for data Scientists. Integrated development environment (IDE). Data operations: Reading, selecting, filtering, manipulating, sorting, grouping, rearranging, ranking, and plotting.

Module 2: Descriptive statistics

[8L]

Descriptive statistics, data preparation. Exploratory Data Analysis data summarization, data distribution,

Measuring asymmetry. Sample and estimated mean, variance and standard score. Statistical Inference

frequency approach, variability of estimates, hypothesis testing using confidence intervals, using p-values

Module 3: Supervised Learning

[8L]

Supervised Learning: First step, learning curves, training-validation and test. Learning models generalities, support vector machines, random forest. Examples

Module 4: Regression Analysis

[7L]

Regression analysis, Regression: linear regression simple linear regression, multiple & Polynomial regression, Sparse model. Unsupervised learning, clustering, similarity and distances, quality measures of clustering, case study

Module 5: Network Analysis

[6L]

Network Analysis, Graphs, Social Networks, centrality, drawing centrality of Graphs, PageRank, Ego-Networks, community Detection

Course Code	YCS5004A			
Course Title	Compiler Design			
Category	ENGG, Major			
LTP& Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	a) Formal Language and Automata Theory b) Computer Organization and Architecture			

Learning Objective:

In this course, students will learn about the fundamental principles in compiler design, the algorithms and data structures involved in the construction of a compiler, and automation tools like lex and yacc for translating high-level languages. At the end of the course, students will be able to build different phases of compilers.

Course Outcome:

CO1: Understand the lexical, syntactic, and semantic structures of a language.

CO2: Recall various techniques to modify the grammar of a given language.

CO3: Understand intermediate representations including symbol table, parse/syntax tree, and data structures required for such representations.

CO4: Understand different techniques for intermediate code and machine code optimization.

CO5: Implement various optimization techniques in the compiler design process.

Course Content:**Module 1: Lexical Analysis****[8L]**

- History of Compiler Design
- Analysis of the Source Program
- The Phases of a Compiler
- Cousins of the Compiler
- The Grouping of Phases
- Compiler Construction Tools
- Need and role of lexical analyzer
- Lexical errors
- Input Buffering
- Specification of Tokens
- Recognition of Tokens
- Design of a Lexical Analyzer Generator
- Use of Lex tool

Module 2: Syntax Analysis**[9L]**

- Need and role of the parser
- Context-Free Grammars
- Top-Down Parsing
- Recursive Descent Parser
- Predictive Parser

- LL(1) Parser
- Shift Reduce Parser
- LR Parser
- LR Item
- Construction of SLR Parsing table
- Introduction to LALR Parser
- Use of YACC / Bison tool
- Design of a syntax analyzer for a sample language

Module 3: Syntax Directed Translation

[7L]

- Syntax-directed Translation schemes
- Implementation of Syntax-directed Translators
- Intermediate code
- Postfix notation
- Parse trees & syntax trees
- Translation of assignment statements
- Boolean expressions
- Statements that alter the flow of control
- Postfix translation
- Translation with a top-down parser
- Translation: Array references in arithmetic expressions, procedure call, declarations, and case statements

Module 4: Code Generation

[6L]

- Data structure for symbol tables
- Representing scope information
- Three address code, quadruple & triples
- Issues in the design of code generator
- The target machine
- Runtime Storage management
- Basic Blocks and Flow Graphs
- Next-use Information
- A simple Code generator
- DAG representation of Basic Blocks

Module 5: Code Optimization

[6L]

- Sources of Optimization
- Peephole Optimization

- Optimization of basic Blocks
- Introduction to Global Data Flow Analysis
- Runtime Environments
- Source Language issues
- Storage Organization
- Storage Allocation strategies
- Access to non-local names
- Parameter Passing

Total Contact Hours	36			

Pre-requisites	a) Data Structures and Algorithms b) Operating Systems c) Discrete Structures
----------------	---

Learning Objective:

In this course, students will learn about various cryptographic techniques essential for understanding how secure information systems can be built. The course will discuss various security applications as case studies, helping students strengthen their basic knowledge in cybersecurity.

Course Outcome:

CO1: Explain the basic concept of cryptography and its applications in network security.

CO2: Learn and analyze various private-key cryptography algorithms.

CO3: Learn and analyze various public-key cryptography algorithms.

CO4: Explain various cryptographic hash functions and their applications in network security.

CO5: Demonstrate how the basic concepts of cryptography can be used to develop practical security applications.

Course Content:

Module 1: Introduction to Cryptography and Block Ciphers [4L]

- Introduction to security attacks, services, and mechanisms.
- Conventional encryption models: private-key and public-key cryptography.
- Classical encryption techniques: substitution and transposition ciphers.

Module 2: Private-key Cryptography [7L]

- Block Cipher: Feistel structure, Shannon's theory of confusion and diffusion, DES, triple-DES, AES.
- Linear and differential cryptanalysis: basic concepts.
- Key distribution problem.
- Stream Cipher: basic concept, realization based on linear feedback shift register.

Module 3: Mathematical Background [7L]

- Modular arithmetic, Fermat's and Euler's theorem, gcd, primality testing.
- Euclid's algorithm, Chinese remainder theorem.
- Intractable problems: integer factorization problem, modular square root problem, discrete logarithm problem.

Module 4: Public-key Cryptography [6L]

- RSA algorithm, security of RSA, key management.
- Diffie-Hellman key exchange algorithm.
- Elliptic curve cryptography: basic concepts.

Module 5: Cryptographic Hash Functions and Authentication [5L]

- Properties of hash functions: MD5 message digest algorithm, secure hash algorithm (SHA-1).
- Digital signatures: authentication protocols, various approaches, digital signature standard (DSS).

Module 6: Network Security [7L]

- Authentication applications: Kerberos, X.509 directory authentication service.
- Electronic mail security: pretty good privacy (PGP), S/MIME.
- Certification: public-key infrastructure.
- Secure socket layer (SSL), transport layer security, secure HTTP (HTTPS), and other secure protocols on the Internet.
- System security: viruses, worms, and malware, firewall systems.

Total Contact Hours	36
Pre-requisites	a. Mathematical Foundation b. Programming Languages

Learning Objectives:

This course provides an introduction to the principles of computer graphics. In particular, the course will consider methods for modeling 2-D objects and generating photorealistic renderings on color raster graphics devices. The emphasis will be on understanding how various elements like algebra, geometry, algorithms, and data structures interact in the design of graphics. Additionally, this course provides an idea of hardware system architecture for computer graphics, including graphics pipeline, frame buffers, and graphic coprocessors.

Course Outcome:

CO1: Students will describe fundamental algorithms used in computer graphics and compare and evaluate them to some extent.

CO2: Students will work and interact, through hands-on experiences, to design, develop, and modify electronically generated imagery using a wide range of sophisticated graphical tools and techniques.

CO3: Students will summarize different hidden surface elimination algorithms and shading techniques used in computer graphics and digital media production.

CO4: Students will explain the technology necessary for creating multimedia content for the web, video, DVD, 2D and 3D graphics, sound, and programming.

CO5: Students can apply knowledge, techniques, skills, and modern tools to become successful professionals in communication and media industries.

Course Content:

Module 1: Introduction

[8L]

- Application areas of Computer Graphics
- Overview of graphics systems
- Video display devices
- Raster-scan systems
- Random scan systems
- Graphics monitors and workstations
- Input devices
- Output primitives: Points and lines
- Line drawing algorithms
- Mid-point circle and ellipse algorithms
- Filled area primitives: Scan line polygon fill algorithm, boundary-fill, and flood-fill algorithms.

Module 2: 2-D Geometrical Transforms

[8L]

- Translation, scaling, rotation, reflection, and shear transformations
- Matrix representations and homogeneous coordinates

- Composite transforms
- Transformations between coordinate systems
- 2-D Viewing: The viewing pipeline
- Viewing coordinate reference frame
- Window to view-port coordinate transformation
- Viewing functions
- Cohen-Sutherland clipping algorithms
- Sutherland-Hodgeman polygon clipping algorithm.

Module 3: 3-D Object Representation

[6L]

- Polygon surfaces
- Quadric surfaces
- Spline representation
- Hermite curve, Bezier curve, and B-spline curves
- Bezier and B-spline surfaces
- Basic illumination models
- Polygon rendering methods.

Module 4: Geometric Transformations

[6L]

- 3-D Geometric transformations: Translation, rotation, scaling, reflection, and shear transformations
- Composite transformations
- 3-D viewing: Viewing pipeline
- Viewing coordinates
- View volume and general projection transforms and clipping.

Module 5: Computer Animation

[8L]

- Design of animation sequence
- General computer animation functions
- Raster animation
- Computer animation languages
- Keyframe systems
- Motion specifications
- Visible-Surface Determination Techniques for efficient Visible-Surface Algorithms
- Categories of algorithms
- Back-face removal
- The z-Buffer Algorithm
- Scan-line method

- Painter's algorithms.

Course Title	Economics for Engineers			
Category	HUM, Minor			
LTP & Credits	L	T	P	Credits
	2	0	0	2
Total Contact Hours	24			
Pre-requisites	None			

Learning Objective:

In this course, students will learn about managerial economics, basics of accounting, and financial management. By the end of the course, students will be able to make different managerial decisions in terms of economics, solve financial statements, and make different financing decisions for businesses and at a personal level.

Course Outcome:

CO1: Apply appropriate engineering economics analysis methods for problem-solving: present worth, annual cost, rate-of-return, payback, break-even, benefit-cost ratio.

CO2: Evaluate the cost-effectiveness of individual engineering projects using the learned methods and draw inferences for investment decisions.

CO3: Compare the life cycle cost of multiple projects using the learned methods and make a quantitative decision between alternate facilities and/or systems.

CO4: Evaluate the profit of a firm, carry out break-even analysis, and employ this tool to make production decisions.

CO5: Discuss and solve advanced economic engineering analysis problems including taxation and inflation.

Course Content:

Module 1: Introduction [3L]

- Managerial Economics
- Relationship with other disciplines
- Firms: Types, Objectives, and goals
- Managerial Decisions-Decision Analysis

Module 2: Demand and Supply Analysis [5L]

- Demand: Types, determinants, function, elasticity, forecasting
- Supply: Determinants, function, elasticity

Module 3: Cost Analysis [5L]

- Elements of costs
- Marginal cost, Marginal Revenue
- Sunk cost, Opportunity cost
- Break-even analysis–PV ratio

Module 4: Elementary Economic Analysis [4L]

- Inflation: Meaning, types, causes, measures to control
- National Income: Definition, Concepts, Method of measuring

Module 5: Financial Accounting [5L]

- Concepts and Definition of Accounting
- Journal, Ledger, Trial Balance
- Trading A/C, Profit & Loss A /C, Balance Sheet

Module 6: Investment Decision [2L]

- Time value of money: Interest - Simple and compound, nominal and effective rate of interest
- Cash flow diagrams
- Principles of economic equivalence
- Evaluation of engineering projects: Present worth, Future worth, Annual worth, Internal rate of return, Cost-benefit analysis for public projects

Total Contact Hours	36				
Pre-requisites	a) Data Structures and Algorithms b) Database Management System c) Programming Practices II				

Learning Objective:

In this course, students will learn the basic principles, techniques, and applications of Artificial Intelligence and Machine Learning for problem-solving, inference, perception, knowledge representation, and puzzles design.

Course Outcomes:

- CO1:** Explain the working principles of PROLOG/LISP and apply LIST structure of PROLOG.
- CO2:** Apply reasoning and inference principles to real-world problems and design programs to solve various puzzles.
- CO3:** Design simple algorithms for data classification in Python/R and test them with benchmark datasets.
- CO4:** Design simple algorithms for data clustering in Python/R and test them with benchmark datasets.
- CO5:** Analyze and evaluate algorithms for estimation/prediction using regression.

Course Content:

Suggestive List of Experiments:

In this laboratory, students will be familiarized with PROLOG/LISP language. The experiments are structured into four modules.

1. Module 1 (4 days):

- Introduction to PROLOG facts & rules using a simple family tree.
- Explanation of how goals are given in PROLOG and simple queries on the family tree.
- Formation of recursive definitions and how PROLOG executes goals.
- Implementation of Graph Search algorithms like DFS, BFS.
- Implementation of well-known puzzles like the 8-queens problem, Towers-of-Hanoi problem, etc.

2. Module 2 (4 days):

- Implementation of Classifiers: KNN, Naive Bayes Classifier, Decision Tree, SVM, Perceptron, Multi-Layer Perceptron, Random Forest, etc., on Python/R platform and test them on benchmark datasets.
- Familiarization with ML Tools: Excel, WEKA, R, Python for classification.

3. Module 3 (3 days):

- Implementation of data clustering algorithms: K-Means, DBSCAN, Hierarchical (AGNES/DIVISIVE), etc., on Python/R platform and test them on benchmark datasets.
- Familiarization with ML Tools: Excel, WEKA, R, Python for clustering.

4. Module 4 (1 day):

- Implementation of Regression (single and Multiple Variables) linear and non-linear, Logistic regression for prediction tasks.

Course Title	Database Management System Laboratory				
Category	ENGG, Major				
LTP & Credits	L	T	P	Credits	

	0	0	3	1.5
Total Contact Hours	36			
Pre-requisites	a)Digital Circuits Laboratory			

Learning Objective:

This course aims to enable students to learn about data models, conceptualize and depict a database system, understand the fundamental concepts of SQL queries, design a database with the necessary attributes, and learn the methodology of accessing, modifying, and updating data and information from relational databases. Additionally, students will learn database design, designing user interfaces, and how to connect with databases.

Course Outcome:

- CO1:To understand the basic concepts regarding databases and SQL queries.
- CO2:To explain the concepts of PL/SQL.
- CO3:To differentiate between DBMS and advanced DBMS.
- CO4:To analyze database system concepts and apply normalization to the database.
- CO5:To apply and create different transaction processing and concurrency control applications.

Course Content:

1. Experiments on fundamentals of database systems:
 - Creating a Database
 - Creating a Table
 - Specifying Relational Data Types
 - Specifying Constraints
 - Creating Indexes (Duration: 2 days)
2. Experiments on database Tables and Record handling:
 - INSERT statement
 - Use of SELECT and INSERT together
 - DELETE, UPDATE, TRUNCATE statements
 - DROP, ALTER statements (Duration: 2 days)
3. Experiments on retrieving data from the database:
 - The SELECT statement
 - Use of the WHERE clause
 - Use of the Logical Operators in the WHERE clause
 - Use of IN, BETWEEN, LIKE, ORDER BY, GROUP BY, and HAVING Clause
 - Use of the Aggregate Functions
 - Combining tables using JOINS
 - Sub-queries (Duration: 3 days)
4. Experiments on Miscellaneous Database Management:

- Creating Views
- Creating Column Aliases
- Creating Database Users
- Use of GRANT and REVOKE (Duration: 1 day)

5. Experiments on PL/SQL:

- Use of decision-making statements
- Different loop structures to solve simple programs (e.g., sum of few numbers, pattern prints, etc.)
- Inserting values into tables, reading data from a table
- Basic working with CURSORS (Duration: 1 day)

6. Innovative Experiments:

- Case study of handling complex databases (e.g., College Management System, Hospital Management System, Library Management System, Payroll Management System, etc.) (Duration: 3 days)

LTP & Credits	L	T	P	Credits
	0	0	3	1.5
Total Contact Hours	36			

Learning Objective:

In this course, students will learn to manipulate data objects, produce graphics, analyze data using common statistical methods, and generate reproducible statistical reports with programming in Python and R. After completing this course, students will

better equipped to solve analytical problems in data science using Python and R.

Course Outcome:

1. CO1: Solve analytical problems using Python and R.
2. CO2: Develop competency in Python and Python libraries such as Pandas, Numpy, and Scipy.
3. CO3: Explain and analyze results effectively using visualizations in Python and R.
4. CO4: Demonstrate how to import, export, and manipulate data and produce statistical summaries of continuous and categorical data in Python and R.
5. CO5: Perform exploratory data analysis using Python and R.

Suggestive List of Experiments:

1. Experiments on basic Python programming. [2 days]
 - Expressions, operators, matrices, decision statements, control flow, and functions.
 - Classes, objects, packages, and files.
 - Tuples, lists, sequences, dictionaries, comprehensions.
2. Experiments based on additional features of Python. [2 days]
 - Numpy arrays objects, creating arrays, basic operations, indexing, slicing, and iterating, copying arrays, shape manipulation, identity array, eye function, universal function.
 - Linear algebra with Numpy, eigenvalues, and eigenvectors with Numpy.
3. Experiments based on Aggregation, Joining, and Pandas Object [3 days]
 - Aggregation and joining.
 - Pandas Object: concatenating and appending data frames, index objects.
 - Handling time series data using Pandas, handling missing values using Pandas.
4. Experiments based on advanced features and statistical techniques. [5 days]
 - Reading and writing the data including JSON data. Web scraping using python, combining and merging, Datasets.
 - Data transformations, Basic matplotlib plots, common plots used in statistical analysis in python, Data types in R.
 - Sequence generation, Vector and subscript, Random number generation in R, Data frames and R functions, Data manipulation, and Data Reshaping using plyr, dplyr, reshape.
 - Parametric statistics and Non-parametric statistics, Continuous and Discrete Probability distribution using R, Correlation and covariance, contingency tables, Overview of Sampling, different sampling techniques, R and data base connectivity.

Semester 6 Curriculum and Syllabus

UNIVERSITY

Course Code	YCS 6006			
Course Title	Data Mining			
Category	Professional Elective			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	a) Data Structures and Algorithms b) Database Management System			

Learning Objective: In this course, students will understand classical models and algorithms in data warehousing and data mining. They will be able to analyze data, identify problems, and choose relevant models and algorithms for application. The course aims to assess the strengths and weaknesses of various methods and algorithms and analyze their behavior.

Course Outcomes:

1. Understand Data Mining Fundamentals and various issues in Data Mining.
2. Understand the architecture of Data Warehousing and its different tools.
3. Apply and analyze the basics of Data Mining techniques and their various functionalities.
4. Understand various issues and challenges of data mining techniques, along with various applications and trends in different areas.
5. Apply Data Mining concepts in real-life applications.

Course Content:

Module 1: Introduction to Data Warehouse and Multi-Dimensional Data [6L]

- Introduction to Data Warehousing
- Data Warehouse Architecture and Infrastructure
- Data Cube and Lattice Structure
- Star, Snowflakes, and Fact Constellation Models
- Components of Data Warehousing
- Building a Data Warehouse
- Mapping the Data Warehouse to a Multiprocessor Architecture
- Reporting and Query Tools and Applications
- Tool Categories

Module 2: Online Analytical Processing (OLAP) Tools [6L]

- Online Analytical Processing (OLAP) vs. Online Transaction Processing (OLTP)
- Need for Multidimensional Data Model
- OLAP Guidelines

- ROLAP vs. MOLAP vs. HOLAP
- Multidimensional vs. Multirelational OLAP
- Categories of OLAP Tools
- OLAP Tools and the Internet

Module 3: Data Mining and Knowledge Discovery Process [6L]

- Introduction to Data Mining
- Types of Data
- AI vs. ML vs. DL
- Data Mining Functionalities
- Data Mining Systems and Task Primitives
- Integration of Data Mining System with Data Warehouse
- Data Preprocessing
- Data Mining vs. Machine Learning
- Prediction with Regression
- Mining Frequent Patterns, Associations, and Correlations
- Apriori Algorithm
- FP Growth Algorithm

Module 4: Supervised and Unsupervised Learning [13L]

- Classification and Prediction
- Basic Concepts
- Decision Tree Induction
- Bayesian Classification
- Lazy Learners (KNN Classification)
- Classification by Backpropagation
- Support Vector Machines
- Clustering and Applications
- Trends in Data Mining
- Categorization of Major Clustering Methods
- Types of Data
- Partitioning Methods
- K-Means Clustering
- K-Medoids Clustering

- Density-Based Methods (DBSCAN)
- Hierarchical Methods (Agglomerative approach)
- Hierarchical Methods (Divisive approach)
- Grid-Based Methods
- Model-Based Clustering Methods

Module 5: Data Mining and Its Applications [5L]

- Clustering High Dimensional Data
- Outlier Analysis
- Data Warehousing Applications
- Data Mining Applications
- Machine Learning Applications Towards Research

Course Code	YCS6007			
Course Title	Software Engineering			
Category	Professional Core			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	a) Object Oriented Programming			

Learning Objective:

- Comprehend various software process models.
- Understand the types of software requirements and Software Requirements Specification (SRS) documents.
- Recognize different software design and architectural styles.
- Learn software testing approaches and metrics used in software development.
- Understand quality control and risk management in software engineering.

Course Outcome:

CO1: Compare and select a process model for a business system.

CO2: Identify and specify the requirements for the development of an application.

CO3: Develop and maintain efficient, reliable, and cost-effective software solutions.

CO4: Critically think and evaluate assumptions and arguments of the client.

CO5: Understand the importance of software maintenance and the techniques involved in maintaining software systems.

Course Content:

Module 1: Introduction to Software Engineering

The evolving role of software

Changing nature of software

Software myths

A generic view of the process

Process models: The waterfall model, Incremental process models, Evolutionary process models,

The Unified Process, Agility and Agile Process model, Extreme Programming, Other process

models of Agile Development and Tools

Module 2: Software Requirements

Functional and non-functional requirements

User requirements, System requirements, Interface specification

Software requirements document

Requirements Engineering process

System models: Context Models, Behavioral models, Data models, Object models

UML Diagrams

Module 3: Design Engineering

Design process and Design quality

Design concepts

Creating architectural design

Object-Oriented Design

User interface design

Module 4: Testing Strategies

A strategic approach to software testing

Test strategies for conventional software
 Black-Box and White-Box testing
 Validation testing, System testing, Debugging
 Product metrics and Metrics for Process and Projects

Module 5: Risk Management and Quality Management

Reactive vs. Proactive Risk strategies
 Risk identification, projection, refinement, RMMM, RMMM Plan
 Quality concepts
 Software quality assurance
 Software Reviews, Formal technical reviews, Statistical Software quality Assurance
 The Capability Maturity Model Integration (CMMI)
 Software reliability
 The ISO 9000 quality standards

Course Title	Statistics for Data Science			
Category	ENGG, Major			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites				

Learning Objective:

Statistics for Data Science is a highly practical course that will provide you with the foundational tools to solve data science problems and prepare you to take the next steps in the world of machine learning.

Course Outcome::

CO1: Analyze, elicit, and specify software requirements by establishing a productive working relationship with various stakeholders, leveraging Statistics for Data Science.

CO2: Design applicable solutions in one or more application domains using Statistics for Data Science approaches that integrate ethical, social, legal, and economic concerns.

CO3: Develop code from the design and effectively apply relevant standards, perform testing, and practice quality management.

CO4: Identify modern engineering tools necessary for software project management, time management, and software reuse, and demonstrate an ability to engage in life-long learning.

CO5: Develop Statistics for Data Science tools for real-life applications.

Course Outline:

Module 1: Introduction [2L]

Objective, scope, and outcome of the course.

Module 2:: Probability Models [4L]

Properties of probability models, combinatorial principle, conditional probability, independence of events.

Module 3: Random Variables and Distributions [6 L] Discrete and continuous distributions, cumulative distribution functions, one-dimensional change of variable, joint distributions, joint probability functions, density functions, conditional independence.

Module 4: Expectation [9L]

Discrete and continuous cases, variance, covariance, and correlation, generating functions, conditional expectation, sampling distribution and limits, convergence in probability and distribution, Monte Carlo approximations, Normal distribution.

Module 5: Statistical Inference [12L]

Models for inference, data collection methods (finite population, simple random sampling, histograms, survey sampling), basic inferences, likelihood inference, Maximum Likelihood Estimation (MLE), inference based on MLE, Bayesian Inference (prior and posterior distributions, inference estimation, Bayesian computations, optimal inference).

Module 6: Model Checking and Stochastic Processes [8L]

Sample model, residual probability plots, Chi-square test, distribution, Markov chains, Poisson processes.

Total Contact Hours	36			
Pre-requisites	a) Computer Networks			

Learning Objective: In this course, students will gain comprehensive knowledge of the technology and protocols driving the Internet. Additionally, they will learn various software technologies essential for developing web pages and web-based applications, equipping them with the skills necessary for creating web-enabled applications.

Course Outcome:

CO1: Explain the technology and protocols underpinning the Internet.

CO2: Appraise the software technologies required for web page development.

CO3: Demonstrate the creation of interactive web pages.

CO4: Explain the security technologies ensuring Internet security.

CO5: Apply Internet Technology in real-life scenarios.

Course Content:

Module 1: Introduction to Internet [6L]

- Overview: Intranet, Extranet, and Internet, including the world-wide web.
- TCP/IP protocol suite: IP datagram format, addressing, routing, fragmentation, IPv4, and IPv6.
- TCP and UDP protocols: header fields, connection establishment, flow control, and congestion control.
- Routing algorithms: Intra- and inter-domain routing, RIP, OSPF, and BGP protocols.

Module 2: Internet Applications [6L]

- Client-server model and Berkeley socket interface.

- Common TCP/IP protocols: ARP, RARP, ICMP, BOOTP, DHCP, FTP, TELNET.
- Domain Name System (DNS) and name resolution.
- Simple Mail Transfer Protocol (SMTP), POP3, and IMAP.
- Hyper-Text Transport Protocol (HTTP) and HTTP server.

Module 3: Hyper-Text Markup Language (HTML) [6L]

- HTML tags and attributes, including advanced features like forms, frames, and image maps.
- Extensible Markup Language (XML) syntax, elements, attributes, validation, and viewing.
- Common Gateway Interface (CGI) Scripts and server-side scripting.

Module 4: Internet Scripting Languages [6L]

- PERL: variables, conditions, loops, arrays, data structures, file handling.
- JavaScript: statements, variables, conditions, loops, objects, cookies, Java Applets.

Module 5: Security and Privacy [6L]

- Network Security fundamentals, cryptographic algorithms, hash functions.
- Security Protocols: Digital Signature, Pretty Good Privacy (PGP), HTTPS.
- Common vulnerabilities, Proxy Server, Network Address Translation (NAT), firewalls.

Module 6: Miscellaneous Topics [6L]

- Internet Telephony and voice over IP (VoIP).
- Multimedia Applications: multimedia over IP, protocols like RSVP, RTP, RTCP, RTSP, streaming media.
- Search Engine and Web Crawler operations.
- Introduction to AJAX: AJAX Internals, XML HTTP request object, AJAX UI tags.

Pre-requisites	Database Management Systems Data Science and Analytics			

Learning Objective:

This course offers an in-depth exploration of Big Data, covering its storage, retrieval, and processing aspects. It delves into the various technologies, tools, and algorithms essential for handling Big Data effectively. Additionally, it empowers students to conduct diverse analytics on different datasets and draw meaningful conclusions.

Course Outcome:

CO1: Explain the significance of Big Data Analytics.

CO2: Apply statistical techniques for analyzing Big Data.

CO3: Analyze data stream mining problems effectively.

CO4: Implement clustering techniques in data mining scenarios.

CO5: Utilize Graph Analytics to derive solutions for Big Data challenges.

Course Content:

- Evolution of Big Data
- Best Practices for Big Data Analytics
- Characteristics and Use Cases of Big Data
- Analytic Scalability and Processes
- Modern Data Analytic Tools
- Statistical Concepts and Techniques
- Regression Modeling and Multivariate Analysis
- Bayesian Modeling and Support Vector Methods
- Time Series Analysis and Rule Induction
- Overview and Applications of Clustering Techniques
- Decision Trees and Naïve Bayes Classification

- Introduction to Stream Concepts and Real-Time Analytics
- Advanced Analytical Theory and Methods including Association Rules and Graph Analytics
- MapReduce, Hadoop, and NoSQL Databases
- Visual Data Analysis Techniques and Statistical Packages
- Approaches to Modeling and Analytics
- Text Analytics and Emerging Trends in Big Data
- Industry Challenges and Applications of Analytics

Total Contact Hours	36				
Pre-requisites	a) Computer Networks b) Operating Systems				

Learning Objective:

To provide students a sound foundation of cloud computing so that they are able to start using and adopting Cloud Computing services and tools in their real-life scenarios. To enable students to explore some important cloud computing-driven commercial systems and applications.

Course Outcome:

CO1: To explain the Cloud architecture, different services, and deployment models.

CO2: To learn the concepts of abstraction and different types of virtualization.

CO3: To identify and explain different cloud offerings with their usage, namely Azure, Google Apps, Amazon Web Services.

CO4: To explain the underlying concepts of cloud management and security and illustrate the use of Service-Oriented Architecture (SOA).

CO5: To analyze and compare different cloud computing providers and services, evaluating their performance, cost-effectiveness, and suitability for specific use cases.

Course Content:

Module 1: Definition of Cloud Computing and its Basics [10L]

- Definition of Cloud Computing: Defining a Cloud, Cloud Types – NIST model, Cloud Cube model, Deployment models (Public, Private, Hybrid, and Community Clouds), Service models – Infrastructure as a Service, Platform as a Service, Software as a Service with examples of services/service providers, Cloud Reference model Characteristics of Cloud Computing – a shift in paradigm Benefits and advantages of Cloud Computing.
- Cloud Architecture: A brief introduction to Composability, Infrastructure, Platforms, Virtual Appliances, Communication Protocols, Applications, Connecting to the Cloud by Clients.
- Services and Applications by Type IaaS – Basic concept, Workload, partitioning of virtual private server instances, Pods, aggregations, silos.
- PaaS – Basic concept, tools, and development environment with examples.
- SaaS - Basic concept and characteristics, Open SaaS and SOA, examples of SaaS platforms.
- Identity as a Service (IDaaS).
- Compliance as a Service (CaaS).

Module 2: Use of Platforms in Cloud Computing [9L]

- Concepts of Abstraction and Virtualization.
- Virtualization technologies: Types of virtualization (access, application, CPU, storage), Mobility patterns (P2V, V2V, V2P, P2P, D2C, C2C, C2D, D2D).
- Load Balancing and Virtualization: Basic Concepts, Network resources for load balancing, Advanced load balancing (including Application Delivery Controller and Application Delivery Network), Mention of The Google Cloud as an example of the use of load balancing.
- Hypervisors: Virtual machine technology and types, VMware vSphere Machine Imaging (including mention of Open Virtualization Format – OVF).
- Porting of applications in the Cloud: The simple Cloud API and AppZero Virtual Application appliance.

Module 3: Use of various Web Services [5L]

- Concepts of Platform as a Service: Definition of services, Distinction between SaaS and PaaS (knowledge of Salesforce.com and Force.com).
- Application development Use of PaaS Application frameworks.
- Use of Google Web Services: Discussion of Google Applications Portfolio – Indexed search, Dark Web, Aggregation and disintermediation, Productivity applications and service, Adwords, Google Analytics, Google Translate, a brief discussion on Google Toolkit (including introduction of Google APIs in brief), major features of Google App Engine service.
- Use of Amazon Web Services: Amazon Web Service components and services: Amazon Elastic Cloud, Amazon Simple Storage system, Amazon Elastic Block Store, Amazon SimpleDB and Relational Database Service.
- Use of Microsoft Cloud Services: Windows Azure platform: Microsoft's approach, architecture, and main elements, overview of Windows Azure AppFabric, Content Delivery Network, SQL Azure, and Windows Live services.

Module 4: Cloud Infrastructure [6L]

- Types of services required in implementation – Consulting, Configuration, Customization, and Support.
- Cloud Management: An overview of the features of network management systems and a brief introduction of related products from large cloud vendors.
- Monitoring of an entire cloud computing deployment stack – an overview with mention of some products.
- Lifecycle management of cloud services (six stages of lifecycle).
- Concepts of Cloud Security: Cloud security concerns, Security boundary, Security service boundary Overview of security mapping Security of data: Brokered cloud storage access, Storage location and tenancy, encryption, and auditing and compliance Identity management (awareness of Identity protocol standards).

Module 5: Concepts of Services and Applications [6L]

- Service Oriented Architecture: Basic concepts of message-based transactions, Protocol stack for an SOA architecture, Event-driven SOA, Enterprise Service Bus, Service catalogs.
- Applications in the Cloud: Concepts of cloud transactions, functionality mapping, Application attributes, Cloud service attributes, System abstraction and Cloud Bursting, Applications and Cloud APIs.
- Cloud-based Storage: Cloud storage definition – Manned and Unmanned Webmail Services: Cloud mail services including Google Gmail, Mail2Web, Windows Live Hotmail, Yahoo mail, concepts of Syndication services.

Course Code	YCS 6005			
Course Title	Cyber Security			
Category				
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	None/if any			

Learning Objective:

Cyber security provides a framework for protecting individuals and organizations from cyber threats, ensuring the privacy and security of digital transactions, and establishing guidelines for ethical and legal conduct in cyberspace.

Course Outcome:

CO1: Understand the evolution of cybersecurity and the emergence of cyberspace, including the legal and technological significance of domain names and the Internet as a tool for global access.

CO2: Analyze cybersecurity, its amendments, limitations, and provisions related to digital signatures, cryptographic algorithms, electronic records, and certifying authorities.

CO3: Evaluate cybersecurity and related legislation, including patent law, trademark law, copyright, and their implications for software, domain names, electronic databases, and civil and criminal procedures.

CO4: Examine cybersecurity and emerging trends.

CO5: Discuss the importance of cyber ethics, the need for cybersecurity in the information society,

artificial intelligence, and blockchain technologies.

Course Content:

Module 1: [6L] Introduction:

Introduction to Cyber security, Importance and challenges in Cybersecurity, Cyberspace, Cyber threats, Cyberwarfare, CIA Triad, Cyber Terrorism, Cybersecurity - Organizational Implications.

Module 2 :[7L]

Hackers and Cyber Crimes: Types of Hackers, Hackers and Crackers, Cyber-Attacks and Vulnerabilities, Malware threats, Sniffing, Gaining Access, Escalating Privileges, Executing Applications, Hiding Files, Covering Tracks, Worms, Trojans, Viruses, Backdoors.

Module 3 : [8L]

Ethical Hacking and Social Engineering: Ethical Hacking Concepts and Scopes, Threats and Attack Vectors, Information Assurance, Threat Modelling, Enterprise Information Security Architecture, Vulnerability Assessment and Penetration Testing, Types of Social Engineering, Insider Attack, Preventing Insider Threats, Social Engineering Targets and Defense Strategies.

Module 4: [10L]

Cyber Forensics and Auditing: Introduction to Cyber Forensics, Computer Equipment and associated storage media, Role of forensics Investigator, Forensics Investigation Process, Collecting Network based Evidence, Writing Computer Forensics Reports, Auditing, Plan an audit against a set of audit criteria, Information Security Management System Management. Introduction to ISO 27001:2013

Module 5: [5L]

Cyber Ethics and Laws: Introduction to Cyber Laws, E-Commerce and E-Governance, Certifying Authority and Controller, Offences under IT Act, Computer Offences and its penalty under IT Act 2000, Intellectual Property Rights in Cyberspace. at Network Layer-IPSec.

Course Code	YCS 6106			
Course Title	Data Mining Laboratory			
Category				
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	None/if any			

Learning objectives:

Upon successful completion of this Lab the student will be able to Practical exposure on implementation of well known data mining Experiments. Exposure to real life data sets for analysis and prediction. Learning performance evaluation of data mining algorithms in a supervised and an unsupervised setting. Handling a small data mining project for a given practical domain. This lab course is intended to introduce data mining techniques including predictive, descriptive and visualization modeling and their effective use in discovering interesting hidden patterns in large volume of data generated by businesses, science, web, and other sources.

Course Outcomes:

CO1: The data mining process and important issues around data cleaning, preprocessing and integration.

CO2: The principle algorithms and techniques used in data mining, such as clustering, association mining, classification and prediction.

CO3: After undergoing the course students will be able to Synthesize the data mining fundamental concepts and techniques from multiple perspectives.

CO4: Develop skills and apply data mining tools for solving practical problems. Advance relevant programming skills.

CO5: Evaluate the ethical implications of data mining practices, including issues related to privacy, bias, and transparency, and propose solutions to mitigate these concerns in a real-world scenario.

List of Experiments:

Experiment 1: List all the categorical (or nominal) attributes and the real-valued attributes separately.

Experiment 2: What attributes do you think might be crucial in making the credit assessment? Come up with some simple rules in plain English using your selected attributes.

Experiment 3: One type of model that you can create is a Decision Tree - train a Decision Tree using the complete dataset as the training data. Report the model obtained after training.

Experiment 4: Suppose you use your above model trained on the complete dataset, and classify credit good/bad for each of the examples in the dataset. What % of examples can you classify correctly? (This is also called testing on the training set) Why do you think you cannot get 100 % training accuracy?

Experiment 5: Is testing on the training set as you did above a good idea? Why or Why not? 6. One approach for solving the problem encountered in the previous question is using crossvalidation? Describe what cross-validation is briefly. Train a Decision Tree again using crossvalidation and report your results. Does your accuracy increase/decrease? Why?

Experiment 6: Check to see if the data shows a bias against "foreign workers" (attribute 20), or "personal-status" (attribute 9). One way to do this (perhaps rather simple minded) is to remove these attributes from the dataset and see if the decision tree created in those cases is significantly different from the full dataset case which you have already done. To remove an attribute you can use the reprocess tab in Weka's GUI Explorer. Did removing these attributes have any significant effect? Discuss.

Experiment 7: Another question might be, do you really need to input so many attributes to get good results? Maybe only a few would do. For example, you could try just having attributes 2, 3, 5, 7, 10, 17 (and 21, the class attribute (naturally)). Tryout some combinations. (You had removed two attributes in problem 7. Remember to reload the arff data file to get all the attributes initially before you start selecting the ones you want.)

Experiment 8: Sometimes, the cost of rejecting an applicant who actually has a good credit (case 1) might be higher than accepting an applicant who has bad credit (case 2). Instead of counting the misclassifications equally in both cases, give a higher cost to the first case (say cost 5) and lower cost to the second case. You can do this by using a cost matrix in Weka. Train your Decision Tree again and report the Decision Tree and cross-validation results. Are they significantly different from results obtained in problem 6 (using equal cost)?

Course Title	Software Engineering Laboratory				
Category	Major				
LTP & Credits	L	T	P	Credits	
	0	0	3	1.5	
Total Contact Hours	36				
Pre-requisites					

Learning Objective:

Discuss and analyze how to develop software requirements specifications for a given problem. To understand Software development as a process. o implement various software designs, data flow models and UML diagrams. To apply various testing techniques like white box testing & black box testing techniques. To have hands on experience in developing a software project by using various software engineering principles and methods.

Course Outcome:

CO1: Ability to translate end-user requirements into system and software requirements

CO2: Ability to generate a high-level design of the system from the software requirements

- CO3:** Will have experience and/or awareness of testing problems and will be able to develop a simple testing report.
- CO4:** Understand and develop various structural and behavioral UML diagrams.
- CO5:** Explain the knowledge of project management tool

Course Content:

List of Experiments:

Do the following exercises for any two projects given in the list of sample projects or any other Projects:

1. Development of Problem Statements.
2. Preparation of Software Requirement Specification Document, Design Documents and Testing Phase related documents.
3. Preparation of Software Configuration Management and Risk Management related documents.
4. Study and usage of any Design phase CASE tool
5. Performing the Design by using any Design phase CASE tools.
6. Develop test cases for unit testing and integration testing
7. Develop test cases for various white box and black box testing techniques.

Sample Projects:

1. Passport automation System
2. Book Bank
3. Online Exam Registration
4. Stock Maintenance System
5. Online course reservation system
6. E-ticketing
7. Software Personnel Management System
8. Credit Card Processing
9. E-book management System.
10. Recruitment system

Category	ENGG,Major				
LTP & Credits	L	T	P	Credits	
	0	0	3	1.5	
Total Contact Hours	36				
Pre-requisites					

Learning Objective:

Statistics is important in data science because it provides the necessary tools and techniques to analyze and interpret data. It helps data scientists make sense of complex datasets, identify patterns, and draw meaningful insights

Course Outcome:

CO1: The student learns the concept of R and Python Programming and Statistical analysis and try formulate new solutions or programs

CO2: Demonstrate an ability to design and develop R and Python programs with this, analysis the data and generate the related report or results.

CO3: Demonstrate an ability to design programming on probability distribution and computed all possible outcomes or required reports..

CO4: Able to do hypothetical analysis and transformation of data into useful manner using Python Programming.

CO5: Able to generate the linear algebra, Monte Carlo Integrations etc by using Python programming.

Course Contents:

List of Experiments:

1. Study R Languages, Commands, etc Consider 50 observations (dataset), generating random data using functions provided, like rbinom, performing basic statistical computations using built-in functions of R. Discussion of R graphics. Histograms. Stem and leaf plots. Boxplots. Scatterplots. Bar graphs plotting the data using line graph, histograms, multiple graphs, etc. Generate 3D graphs or plots.
2. Measures of Central Tendency: Given a sample of 50 Observations (from any dataset), use possible functions R or Python and calculate mean, sd, var, min, max, median, range, and quantile. Discuss the properties of this distribution. generate bell curve of a random normal distribution.
3. Pragmatic matters. Tabulating data. Transforming a variable. Subsetting vectors and data frames
4. (i) Consider 100 observations, find out Correlation “cor()” and Covariance “cov()” and programs on Frequencies and Crosstabs. (ii) Finding and analyze the missing data.
5. Sorting, transposing and merging data. Reshaping a data frame. Basics of text processing. Reading unusual data files. Basics of variable coercion.
6. Hypothesis testing and t-test for any given dataset. Find out null hypothesis, alternate hypothesis, draw the picture (graph) to visualize problem. Test the value of population mean.
7. State alpha level and rejection region, estimate the maximum likelihood and inference.
8. Binomial simulation: Making the computer flip coins for you. Make use of rbinom function of R to generate samples, and other functions: counts, avgs, mean, sd, sqrt, hist (histogram).
9. Bayesian Hypothesis testing on any given dataset or dataframe.
10. Use seaborn and combines simple statistical fits with plotting on pandas dataframes
11. Working on Linear Algebra and Linear Systems
12. : Working on Monte Carlo Integration (Quasi-random numbers and find out the variance on any dataframe)

CO-PO Mapping:

Course Title	Innovation, Entrepreneurship & IPR				
Category					
LTP & Credits	L	T	P	Credits	
	3	0	0	3	
Total Contact Hours	36				
Pre-requisites	None/if any				

Learning Objective:

IPR safeguards the ideas and innovations of entrepreneurs, ensuring that their original works and inventions are protected from potential infringement and unauthorized use. This protection is crucial for fostering a conducive environment for creativity and innovation.

Course Outcomes:

CO1: Students should be able to demonstrate an understanding of the basic concepts of Intellectual Property Rights (IPR).

CO2: Students should be able to differentiate between Trademarks, Trade Secrets, and Geographical Indications (GI) of goods.

CO3: Students should be able to understand Copyrights, Patents, and Industrial Designs.

CO4: Students should be able to manage and protect IP.

CO5: Students will gain knowledge on Cyberlaw.

Module 1: Introduction to Intellectual Property Rights

- Introduction to Intellectual Property Rights
- Types of intellectual property
- Importance of intellectual property rights
- Evolution of IP acts and treaties
- Agencies responsible for IPR registrations
- Role and value of IP in international commerce
- Issues affecting IP internationally

Module 2: Trade Marks, Trade Secrets, and Geographical Indication of Goods

- Purpose and function of trademarks
- Acquisition of trade mark rights
- Transfer of rights
- Selecting and evaluating trademarks
- Registration of trademarks
- Claims
- Trade secret law
- Determination of trade secret status
- Liability for misappropriation of trade secrets
- Trade secret litigation
- Basic aspects and need for the registration of Geographical Indication of Goods

Module 3: Copyrights, Patents, and Industrial Designs

- Fundamentals of copyright law
- Originality of material
- Right of reproduction
- Right to perform the work publicly
- Copyright ownership issues
- Notice of copyright
- Foundation of patent law
- Patent searching process
- Basic criteria of patentability
- Kind of protection provided in Industrial design

Module 4: Managing IP Rights

- Acquiring IP Rights: letters of instruction, joint collaboration agreement
- Protecting IP Rights: non-disclosure agreement, cease and desist letter, settlement memorandum
- Transferring IP Rights: Assignment contract, license agreement, deed of assignment

Module 5: Introduction to Cyberlaw

- Information Technology Act
- Cybercrime and e-commerce
- Data security, confidentiality, privacy
- International aspects of computer and online crime

7th semester Curriculum and Syllabus

Course Code	YCS 7005			
Course Title	Big Data Technology			
Category	Major ENGG			
LTP & Credits	L	T	P	Credits
	3	0	0	4
Total Contact Hours	36			
Pre-requisites				

Course Objectives:

- Understand the Big Data Platform and its Use cases
- Provide an overview of Apache Hadoop
- Provide HDFS Concepts and Interfacing with HDFS
- Understand Map Reduce Jobs
- Provide hands on Hadoop Eco System
- Apply analytics on Structured, Unstructured Data.
- Exposure to Data Analytics with R.

Course Outcomes:

The students will be able to:

- CO 1: Identify Big Data and its Business Implications.
CO 2: List the components of Hadoop and Hadoop Eco-System
CO 3: Access and Process Data on Distributed File System
CO 4: Manage Job Execution in Hadoop Environment
CO 5: Develop Big Data Solutions using Hadoop Eco System

Module 1: Introduction to Big Data and Hadoop

- Types of Digital Data
- Introduction to Big Data
- Big Data Analytics
- History of Hadoop
- Apache Hadoop
- Analyzing Data with Unix Tools
- Analyzing Data with Hadoop
- Hadoop Streaming
- Hadoop Ecosystem
- IBM Big Data Strategy
- Introduction to InfoSphere BigInsights and BigSheets

Module 2: HDFS (Hadoop Distributed File System)

- The Design of HDFS
- HDFS Concepts
- Command Line Interface
- Hadoop File System Interfaces
- Data Flow
- Data Ingest with Flume and Scoop
- Hadoop Archives
- Hadoop I/O: Compression, Serialization, Avro, and File-Based Data Structures

Module 3: MapReduce

- Anatomy of a MapReduce Job Run
- Failures
- Job Scheduling
- Shuffle and Sort
- Task Execution
- MapReduce Types and Formats
- MapReduce Features

Module 4: Hadoop Ecosystem

- Pig: Introduction to Pig, Execution Modes of Pig, Comparison of Pig with Databases, Grunt, Pig Latin, User-Defined Functions, Data Processing Operators
- Hive: Hive Shell, Hive Services, Hive Metastore, Comparison with Traditional Databases, HiveQL, Tables, Querying Data, and User-Defined Functions
- HBase: HBasics, Concepts, Clients, Example, HBase Versus RDBMS
- Big SQL: Introduction

Module 5: Data Analytics with R

- Machine Learning: Introduction, Supervised Learning, Unsupervised Learning, Collaborative Filtering
- Big Data Analytics with BigR

Total Contact Hours	36			
Pre-requisites				

Learning Objective:

Neural networks can help computers make intelligent decisions with limited human assistance. This is because they can learn and model the relationships between input and output data that are nonlinear and complex. Deep learning covers the theory and practice of a big family of very effective techniques today in the domain of machine learning. The objective of the course is to enable students to get familiarity with this area and to gain adequate knowledge to apply the techniques in solving real world problems.

Course Outcome:

- CO1:** Able to understand the mathematics behind functioning of artificial neural networks
- CO2:** Able to analyze the given dataset for designing a neural network based solution
- CO3:** Able to carry out design and implementation of deep learning models for signal/image processing applications
- CO4:** Able to design and deploy simple TensorFlow-based deep learning solutions to classification problems
- CO5:** Able to apply deep learning techniques to solve real-world problems, demonstrating an understanding of the practical applications of neural networks.

Course Content:

Module 1: [4L]

Introduction: Various paradigms of learning problems, Perspectives and Issues in deep learning framework, review of fundamental learning techniques.

Module 2: [6L]

Feed forward neural network: Artificial Neural Network, activation function, multi-layer neural network. Cardinality, operations, and properties of fuzzy relations.

Module 3: [6L]

Training Neural Network: Risk minimization, loss function, backpropagation, regularization, model selection, and optimization.

Module 4: [8L]

Conditional Random Fields: Linear chain, partition function, Markov network, Belief propagation, Training CRFs, Hidden Markov Model, Entropy.

Module 5: [6L]

Deep Learning: Deep Feed Forward network, regularizations, training deep models, dropouts, Convolutional Neural Network, Recurrent Neural Network, Deep Belief Network.

Module 6: [6L]

Deep Learning research: Object recognition, sparse coding, computer vision, natural language

	3	0	0	3
Total Contact Hours	36			
Pre-requisites				

Learning Objective:

The course aims to introduce students to the fundamentals of image formation, major ideas, methods, and techniques of computer vision and pattern recognition. It also aims to develop an appreciation for various issues in the design of computer vision and object recognition systems, and provide students with programming experience by implementing computer vision and object recognition applications.

Course Outcome:

1. CO1: Identify basic concepts, terminology, theories, models, and methods in the field of computer vision.
2. CO2: Describe known principles of the human visual system.
3. CO3: Describe basic methods of computer vision related to multi-scale representation, edge detection, detection of other primitives, stereo, motion, and object recognition.
4. CO4: Suggest a design of a computer vision system for a specific problem.
5. CO5: Apply computer vision techniques to solve real-world problems, such as image classification, object detection, and image segmentation.

Course Content:

Module 1: Introduction to Computer Vision and Image Formation (10L)

- Geometric primitives and transformations
- Photometric image formation
- Digital camera
- Image Processing: point operators, linear filtering, neighborhood operators, Fourier transforms, and segmentation.

Module 2: Feature Detection, Matching, and Alignment (12L)

- Points and patches
- Edges, lines
- Feature-based alignment: 2D, 3D feature-based alignment, pose estimation
- Image Stitching
- Dense motion estimation: Optical flow, layered motion, parametric motion
- Structure from Motion.

Module 3: Recognition and Stereo Correspondence (14L)

- Object detection, face recognition, instance recognition, category recognition
- Stereo Correspondence: Epipolar geometry, correspondence, 3D reconstruction.

Total Contact Hours	36			
Pre-requisites				

Learning Objective:

To understand the advanced concepts of Parallel and Distributed Computing and apply them in the implementation of parallel algorithms for the assessment of the course by the students.

Course Outcome:

1. CO1: Understand implicit and explicit parallel platforms.
2. CO2: Decompose a given problem into many sub problems using different decomposition techniques.
3. CO3: Use different performance metrics for the analysis of parallel algorithms.
4. CO4: Utilize message passing libraries for communication among processes running on parallel platforms.
5. CO5: Develop parallel algorithms for shared address space platforms using multithreading.

Course Content:

Module 1: Parallel Programming Platforms [6L]

- Implicit Parallelism: Trends in Microprocessor Architectures
- Limitations of Memory System Performance
- Dichotomy of Parallel Computing Platforms
- Physical Organization of Parallel Platforms
- Communication Costs in Parallel Machines
- Routing Mechanisms for Interconnection Networks
- Impact of Process-Processor Mapping and Mapping Techniques

Module 2: Principles of Parallel Algorithm Design [6L]

- Preliminaries
- Decomposition Techniques
- Characteristics of Tasks and Interactions
- Mapping Techniques for Load Balancing
- Methods for Containing Interaction Overheads
- Parallel Algorithm Models

Module 3: Basic Communication Operations [8L]

- One-to-All Broadcast and All-to-One Reduction

- All-to-All Broadcast and Reduction
- All-Reduce and Prefix-Sum Operations
- Scatter and Gather
- All-to-All Personalized Communication
- Circular Shift
- Improving the Speed of Some Communication Operations

Module 4: Analytical Modeling of Parallel Programs [6L]

- Sources of Overhead in Parallel Programs
- Performance Metrics for Parallel Systems
- Effect of Granularity and Data Mapping on Performance
- Amdahl's Law
- Scalability of Parallel Systems
- Minimum Execution Time and Minimum Cost-Optimal Execution Time
- Asymptotic Analysis of Parallel Programs
- Other Scalability Metrics

Module 5: Programming Using the Message Passing Paradigm [10L]

- Principles of Message-Passing Programming
- The Building Blocks: Send and Receive Operations
- MPI: The Message Passing Interface
- Collective Communication and Computation Operations
- Groups and Communicators
- Programming Shared Address Space Platforms
- Thread Basics: Why Threads?
- The POSIX Thread Application Programming Interface
- Synchronization Primitives in POSIX
- Controlling Thread and Synchronization Attributes
- Thread Synchronization Constructs
- OPEN MP
- Applications: Cancellation, Composite Parallel Algorithm Development for Matrix Multiplication, Sorting, and Graph

Pre-requisites				

Learning Objective:

The primary professional objective of a web developer is to write code to create websites, employing various programming techniques and tools to deliver high-quality results. Web technology refers to the means by which computers communicate with each other using markup languages and multimedia packages. It provides a way to interact with hosted information, like websites.

Course Outcome:

- CO1: Design and develop web applications.
- CO2: Explain client and server-side scripting and their applicability.
- CO3: Create scripts using JavaScript in a web page.
- CO4: Integrate JavaScript in a web page.
- CO5: Design forms and check for data accuracy.

Course Content:

Module 1: Web Basics and Overview (7L)

- Introduction to Internet, World Wide Web, Web Browsers

- URL, MIME, HTTP
- Web Programmer's Toolbox
- HTML Common tags: List, Tables, images, forms, frames
- Cascading Style Sheets (CSS) & its Types
- Introduction to JavaScript
- Declaring variables, functions
- Event handlers (onclick, onsubmit, etc.)
- Form Validation

Module 2: Introduction to XML and PHP (6L)

- Document type definition
- XML Schemas
- Presenting XML
- Introduction to XHTML
- Using XML Processors: DOM and SAX
- PHP: Declaring Variables, Data types, Operators, Control structures, Functions

Module 3: Web Servers, Servlets, and Database Access (6L)

- Introduction to Servlets
- Lifecycle of a Servlet
- JSDK, Deploying Servlet
- The Servlet API
- The javax. Servlet Package
- Reading Servlet parameters
- Reading Initialization parameters
- The javax.servlet HTTP package
- Handling Http Request & Responses
- Cookies and Session Tracking

Module 4: Database Access and JSP Application Development (17L)

- Database Programming using JDBC
- JDBC drivers
- Studying javax.sql.* package
- Connecting to database in PHP
- Execute Simple Queries
- Accessing a Database from a Servlet
- Introduction to struts frameworks

- JSP Application Development
- The Anatomy of a JSP Page
- JSP Processing
- JSP Application Design and JSP Environment
- JSP Declarations, Directives, Expressions, Scripting Elements, implicit objects
- Java Beans: Introduction to Beans, Deploying Java Beans in a JSP page

	3	0	0	3
Total Contact Hours	36			
Pre-requisites	a) Probability and Statistics b) Design and Analysis of Algorithms			

Learning Objective:

The main objective of image processing is to transform an image into digital form and perform certain operations on it in order to obtain specific models or to extract useful information from the image.

Course Outcome:

CO1: Upon successfully completing the course, the students should:

CO2: Have an appreciation of the fundamentals of Digital Image Processing including the topics of filtering, transforms and morphology, and image analysis and compression.

CO3: Be able to implement basic image processing algorithms in MATLAB.

CO4: Have the skill base necessary to further explore advanced topics of Digital Image Processing.

CO5: Be in a position to make a positive professional contribution in the field of Digital Image Processing.

Course Content:

UNIT I Digital image fundamentals & Image Transforms: Digital Image fundamentals, Sampling and quantization, Relationship between pixels. Image Transforms: 2-D FFT, Properties. Walsh transform, Hadamard Transform, Discrete cosine Transform, Discrete Wavelet Transform.

UNIT II Image enhancement (spatial domain): Introduction, Image Enhancement in Spatial Domain, Enhancement Through Point Operation, Types of Point Operation, Histogram Manipulation, gray level Transformation, local or neighborhood operation, median filter, spatial domain high-pass filtering. Image enhancement (Frequency domain): Filtering in Frequency Domain, Obtaining Frequency Domain Filters from Spatial Filters, Generating Filters Directly in the Frequency Domain, Low Pass(smoothing) and High Pass (sharpening) filters in Frequency Domain

UNIT III Image Restoration: Degradation Model, Algebraic Approach to Restoration, Inverse Filtering, Least Mean Square Filters, Constrained Least Squares Restoration.

UNIT IV Image segmentation: Detection of discontinuities. Edge linking and boundary detection, Thresholding, Region-oriented segmentation Morphological Image Processing: Dilation and Erosion, Dilation, Structuring Element Decomposition, Erosion, Combining Dilation and Erosion, Opening and Closing, The Hit or Miss Transformation.

UNIT V Image Compression: Redundancies and their Removal Methods, Fidelity Criteria, Image Compression Models, Huffman and Arithmetic Coding, Error-Free Compression, Lossy Compression, Lossy and Lossless Predictive Coding, Transform Based Compression, JPEG 2000 Standards.

Learning Objective:

The main objective of the course is to expose the students to soft computing, various types of soft computing techniques, and applications of soft computing. Upon completion of this course, the student should be able to get an idea on: Artificial Intelligence, Various types of production systems, characteristics of production systems. Neural Networks, architecture, functions and various algorithms involved. Fuzzy Logic, Various fuzzy systems and their functions. Genetic algorithms, its applications and advances.

Course Outcome:

At the end of the course the student should be able to

- CO1:** To learn about soft computing techniques and their applications
- CO2:** To analyze various neural network architectures
- CO3:** To understand perceptron and counter propagation networks
- CO4:** To Define the fuzzy systems
- CO5:** To analyze the genetic algorithms and their applications

Course Content:

1. Introduction

- Introduction to soft computing
- Introduction to fuzzy sets and fuzzy logic systems
- Introduction to biological and artificial neural networks
- Introduction to Genetic Algorithm

2. Fuzzy Sets and Fuzzy Logic Systems

- Classical Sets and Fuzzy Sets and Fuzzy relations
- Operations on Classical sets, properties of classical sets
- Fuzzy set operations, properties of fuzzy sets, cardinality
- Membership functions, standard forms, boundaries, fuzzification methods
- Fuzzy to Crisp conversions, Lambda Cuts, Defuzzification methods
- Classical Logic and Fuzzy Logic, Approximate reasoning, Fuzzy Implication
- Fuzzy Rule based Systems, Linguistic Hedges, Fuzzy Rule based system, Fuzzy Inference System, Mamdani Fuzzy Models, Sugeno Fuzzy Models
- Applications of Fuzzy Logic in Home Appliances, General Fuzzy Logic controllers, Basic Medical Diagnostic systems, Weather forecasting

3. Neural Network

- Introduction to Neural Networks
- Biological Neurons and Artificial neural network
- Model of artificial neuron
- Learning Methods: Hebbian, competitive, Boltzmann etc.
- Neural Network models: Perceptron, Adaline, Madeline networks, single layer network
- Back propagation and multi-layer networks
- Competitive learning networks: Kohonen self-organizing networks, Hebbian learning, Hopfield Networks
- Neuro-Fuzzy modeling
- Applications of Neural Networks in Pattern Recognition and classification

4. Genetic Algorithms

- Simple GA, crossover, mutation
- Multi-objective Genetic Algorithm (MOGA)
- Applications of Genetic Algorithm in search and optimization, GA based clustering Algorithm, Image processing, pattern Recognition

5. Other Soft Computing techniques

- Simulated Annealing, Tabu search, Ant colony optimization (ACO), Particle Swarm Optimization (PSO)

Pre-requisites				

Learning Objective:

Neural networks enable computers to make intelligent decisions with limited human assistance by learning and modeling complex, nonlinear relationships between input and output data. Deep learning encompasses a broad range of highly effective techniques in machine learning. The objective of this course is to familiarize students with this field and equip them with the knowledge to apply these techniques to real-world problems.

Course Outcome:

CO1: Understand the mathematics behind artificial neural networks' functioning. CO2: Analyze datasets to design neural network-based solutions. CO3: Design and implement deep learning models for signal/image processing applications. CO4: Design and deploy TensorFlow-based deep learning solutions for classification problems. CO5: Apply deep learning techniques to solve real-world problems, demonstrating practical neural network applications.

Course Content:

Module 1: Introduction [4L]

- Various paradigms of learning problems
- Perspectives and issues in deep learning framework
- Review of fundamental learning techniques

Module 2: Feed Forward Neural Network [6L]

- Artificial Neural Network
- Activation function
- Multi-layer neural network

- Cardinality, operations, and properties of fuzzy relations

Module 3: Training Neural Network [6L]

- Risk minimization
- Loss function
- Backpropagation
- Regularization
- Model selection and optimization

Module 4: Conditional Random Fields [8L]

- Linear chain
- Partition function
- Markov network
- Belief propagation
- Training CRFs
- Hidden Markov Model
- Entropy

Module 5: Deep Learning [6L]

- Deep Feed Forward network
- Regularizations
- Training deep models
- Dropouts
- Convolutional Neural Network
- Recurrent Neural Network
- Deep Belief Network

Module 6: Deep Learning Research [6L]

- Object recognition
- Sparse coding
- Computer vision
- Natural language

Total Contact Hours	36				
Pre-requisites					

Learning Objective:

To provide an understanding of the basic principles of Organizational Behavior to acquaint students with managerial skills and the required inputs for human resource management.

Course Outcome:

CO1: Define and explain the basic concepts of Organizational Behavior and motivation. CO2: Explain essential concepts of organizational conflicts, resolution through negotiation, change management, and organizational development. CO3: Familiarize with various aspects of HR to deal effectively with people resourcing, talent management, and HR functions in an organization. CO4: Understand the concepts of HRD, its role, and importance in organizational success. CO5: Develop an understanding of compensation management and industrial relations.

Course Content:

Module 1: Introduction to Organizational Behavior

- Meaning and scope of organizational behavior
- Challenges and Opportunities
- Foundations of Individual behavior
- Motivation Theories (Maslow, ERG, Douglas McGregor two-factor theory)
- Group dynamics
- Leadership styles

Module 2: Organizational Conflict and Change Management

- Causes and consequences of organizational conflict
- Conflict and negotiation
- Organizational change
- Change management process
- Resistance to change
- Flexibility and crisis management
- Organizational Development concepts and significance

Module 3: Human Resource Management

- Meaning, definition, and functions of HRM
- Job Analysis and Job Design
- Human Resource Planning
- Recruitment and Selection
- Sources of Recruitment
- Selection process
- Placement and Induction

Module 4: Human Resource Development

- Concepts of HRD
- Training and Development
- Methods of training
- Importance of Performance Appraisal
- Traditional and modern methods of performance appraisal
- Job Evaluation
- Methods of Job Evaluation
- Wage and Salary Administration

Module 5: Compensation and Industrial Relations

- Compensation concepts and principles
- Influencing Factors
- Emerging Trends in Compensation
- Methods of Payment
- Incentives and Rewards
- Managing Industrial Relations
- Emerging trends and practices in human resource management

Learning Objective:

Identify, formulate, and solve problems in computer vision. Evaluate computer vision systems by applying theories and methods used in the field. Design and develop innovative computer vision applications or systems.

Course Outcome:

After completing the course you will be able to

- CO1:** To identify basic concepts, terminology, theories, models and methods in the field of computer vision.
- CO2:** To describe known principles of human visual system.
- CO3:** To describe basic methods of computer vision related to multi-scale representation, edge detection and detection of other primitives, stereo, motion and object recognition
- CO4:** To suggest a design of a computer vision system for a specific problem.
- CO5:** To apply advanced techniques such as deep learning models, convolutional neural networks, and feature extraction methods in computer vision tasks.

Course Content:

List of Experiments:

1. Introduction to python programming.
2. Write a program to display the negative of a digital image.
3. Write a program to perform thresholding on a digital image.
4. Write a program to perform gray level slicing without background
5. Perform basic Image Handling and Processing operations on the image.
6. Geometric Transformation.
7. Compute Homography Matrix
8. Perspective Transformation
9. Camera Calibration
10. Compute Fundamental Matrix
11. Edge Detection, Line Detection and, Corner Detection
12. SIFT Feature descriptor
13. SURF and HOG feature descriptor
14. Project based on Computer Vision Applications

Requirements: install the Anaconda, Spyder (Scientific Python Development Environment) IDE for Computer Vision Lab.

Hours	
Pre-requisites	

Learning Objective:

Parallel programming is ubiquitous in today's multi-core era and solves many real-world scientific problems. Massive parallelism entails significant hardware and software challenges. The course is structured so that the participants understand challenges in efficient execution of large-scale parallel applications. The assignments will be designed to strengthen understanding of parallel programming. The course will also involve a research-based project component.

Course Outcome:

At the end of this course student will:

- CO1:** To solve the problems in parallel
- CO2:** To have knowledge on different structures of parallel computers
- CO3:** To understand the performance evaluation of parallel computers
- CO4:** To get acquaintance on CUDA
- CO5:** To develop parallel programs in CUDA C

Course Content:

List of Experiments:

1. a) Implement Parallel Reduction using Min, Max, Sum and Average operations.
2. b) Write a CUDA program that, given an N-element vector, find-
 - i. The maximum element in the vector
 - ii. The minimum element in the vector
 - iii. The arithmetic mean of the vector
 - iv. The standard deviation of the values in the vector
3. Vector and Matrix Operations-
 - a. Design parallel algorithm to
 - b. Add two large vectors
 - c. Multiply Vector and Matrix
 - d. Multiply two $N \times N$ arrays using n^2 processors
4. Message passing and Message matching in MPI
5. Broadcast and reduction in MPI
6. Working with MPI derived types
7. Pthreads- synchronization using mutex and busy waiting
8. Pthreads- synchronization using semaphores- Producer Consumer problem
9. Pthreads-thread synchronization using barriers and condition variables
10. Implementation of concurrent List with Pthread read write locks
11. Reduction clause in OpenMP
12. Program using parallel for directive in OpenMP
13. Scheduling loops in OpenMP – Odd even transposition sort
14. Synchronization in OpenMP - Producer Consumer problem
15. Working with OpenCL buffers and image object

Total Contact Hours	36				
Pre-requisites					

Learning Objective:

This course is intended to teach the basics involved in publishing content on the World Wide Web. This includes the 'language of the Web'—HTML, the fundamentals of how the Internet and the Web function, a basic understanding of graphic production with a specific stress on creating graphics for the Web, and a general grounding introduction to more advanced topics such as programming and scripting. This will also expose students to the basic tools and applications used in Web publishing.

Course Outcome:

The students will be able to:

- CO1:** Analyze a web page and identify its elements and attributes.
- CO2:** Create web pages using XHTML and Cascading Style Sheets.
- CO3:** Build dynamic web pages using Java Script (Client side programming).
- CO4:** Create XML documents and Schemas.
- CO5:** Understand the basic concepts and principles of web security, including common vulnerabilities and best practices for securing web applications and data transmission.

Course Content:

List of Experiments:

1. HTML Table Creation:
 - Create an HTML table with the following details:
 - Book Name
 - Author
 - Operating Systems - Godbole
 - Data Communications and Networks - Godbole
 - Computer Networks - Rajkumar
 - OOPs - R.NageswaraRao
2. Form Creation with Input Attributes:
 - Create an HTML form with various attributes for input tags.
3. Multiple Stylesheets in a Single Page:
 - Create a web page that uses multiple types of stylesheets.
4. CGI Sample Program:
 - Write a CGI program to send output back to the user.
5. JavaScript Program with Variables:
 - Write a JavaScript program using variables.
6. JavaScript Program for Multiplication:
 - Write a JavaScript program to multiply two numbers and display the result in a separate text box.
7. JavaScript Program for Form Validation:
 - Write a JavaScript program for form validations.
8. AJAX Program for XML Http Request:
 - Write an AJAX program to check the presence of the XML Http Request object.
9. AJAX Program for Sales Report:
 - Write a program to create a sales report for books using AJAX.
10. XML Document Template for Student Results:
 - Create an XML document template to describe the results of students in an examination. Include the student's roll number, name, three subject names and marks, total marks, percentage, and results.
11. XSLT Code for Book Titles and Prices:
 - Write XSLT code to retrieve only the book titles and their prices.
12. Homepage Design:
 - Design basic elements of a homepage.

Total Contact Hours	36			
Pre-requisites	None/if any			

Learning Objectives:

To introduce the concepts of image processing and basic analytical methods to be used in image processing. To familiarize students with image enhancement and restoration techniques, To explain different image compression techniques. To introduce segmentation and morphological processing techniques.

Course Outcome:

CO1: Image Processing Fundamentals
CO2: Image Enhancement Techniques
CO3: Image Classification and Analysis
CO4: Image Fusion and Feature Extraction
CO5: Accuracy Assessment and Applications

Course Contents:

Exercises:

1. Image reading and writing
2. Pre-processing techniques: radiometric correction
3. Random and Periodic Noise removal
4. Pre-processing techniques: Ground control and rectification
5. Enhancements – histogram, filters
6. Band rationing and normalization – NDVI, SAVI & NDWI
7. PCA
8. Image fusion
9. Classification –supervised &unsupervised
10. Sub-pixel classification

11. Classification using Neural Network and Fuzzy Logic
12. Accuracy assessment – correlation, RMSE & kappa
13. Crop conditioning assessment/ inundation damage assessment/ forest fire/ change dynamic analysis

Pre-requisites					

Learning Objective:

Soft computing helps users to solve real-world problems by providing approximate results that conventional and analytical models cannot solve. It is based on Fuzzy logic, genetic algorithms, machine learning, ANN, and expert systems.

Course Outcome:

- CO1: Understand the fundamental theory and concepts of neural networks.
 CO2: Illustrate the soft computing techniques like neural network and fuzzy logic and their roles in building intelligent systems.
 CO3: Illustrate and implement various learning rules.
 CO4: Comprehend fuzzy logic and the concept of fuzziness involved in various systems and fuzzy set theory.
 CO5: Design and implement real-life examples using fuzzy logic and genetic algorithms.

List of Experiments:

1. Write a Program to implement MP Model
2. Generate ANDNOT function using McCulloch-Pitts neural net.
3. Generate XOR function using McCulloch-Pitts neural net
4. Write a program for solving linearly separable problem using Perceptron Model
5. Perceptron net for an AND function with bipolar inputs and targets.
6. Write a program to store a pattern (1 1 1 0). Test the network using Discrete Hopfield Net by giving the input with mistakes in First and Second position
7. Program for Pattern storage of 10 digits with Discrete Hopfield Network
8. To perform Union, Intersection and Complement operations.
9. To implement De-Morgan's Law.
10. To implement FIS Editor.

Pre-requisites					

Learning Objective:

To build the Foundation of Deep Learning and understand how to build the neural network.
Enable students to develop successful machine learning concepts.

Course Outcome:

- CO1:** To Understand basic neuron models and learning algorithms by using Matlab's neural network toolbox
- CO2:** To Describe about different activation function (transfer function).
- CO3:** To Analyze how weights & bias values affect the output of neuron
- CO4:** To Identify how weights & bias values are able to represent a decision boundary in the feature space
- CO5:** To Conceptualize about perceptron learning rule works for linearly separable problems

Course Content:

List of Experiments:

1. To write a program to implement Perception.
2. To write a program to implement AND OR gates using Perception.
3. To implement Crab Classification using pattern net Objective.
4. To write a program to implement Wine Classification using Back propagation
5. Write a MatLab Script containing four functions Addition, Subtraction, Multiply and Divide functions.
6. Write a program to implement classification of linearly separable Data with a perceptron.
7. To study ImageNet, GoogleNet, ResNet convolutional Neural Networks.
8. To study Convolutional Neural Network and Recurrent Neural Network.
9. Write a program to draw a graph with multiple curve.
10. How the weight and biased value are able to represent a decision boundary in the feature space.
11. Write a program to develop Auto encoders using MNIST Handwritten Digits.
12. Write a program to develop a GAN for Generating MNIST Handwritten Digits.

Curriculum and Syllabus

UNIVERSITY

Course Code	YCS 8001 E			
Course Title	Natural Language Processing			
Category	Professional Elective			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	a) Design and Analysis of Algorithms b) Compiler Design			

Learning Objective:

In this course, students will learn about various Natural Language Processing techniques essential for understanding how to build Language Processing systems. Specifically, various security applications shall be discussed as case studies. The course will be very helpful for students in strengthening their basic knowledge in Language Processing.

Course Outcome:

CO1: To explain the basic concept of NLP and its applications.

CO2: To learn and analyze various NLP Tools.

CO3: To learn and analyze various NLP Concepts.

CO4: To apply the basic understanding of NLP in real language processing environments.

CO5: To design and implement a natural language processing system for a specific application, demonstrating proficiency in using NLP techniques and tools.

Course Content:

Module 1: Introduction to NLP [7L] Introduction: Human languages, models, ambiguity, processing paradigms; Phases in natural language processing, applications. Text representation in computers, encoding schemes. Linguistics resources - Introduction to corpus, elements in balanced corpus, TreeBank, PropBank, WordNet, VerbNet, etc. Resource management with XML.

Module 2: Management of Linguistic Data [7L] Management of linguistic data with the help of GATE, NLTK. Regular expressions, Finite State Automata, word recognition, lexicon. Morphology, acquisition models, Finite State Transducer. N-grams, smoothing, entropy, HMM, ME, SVM, CRF.

Module 3: Speech Tagging and Applications [8L] Part of Speech tagging: Stochastic POS tagging, HMM, Transformation-based tagging (TBL), Handling of unknown words, named entities, multiword expressions. A survey on natural language grammars, lexeme, phonemes, phrases and idioms, word order, agreement, tense, aspect, and mood, and agreement, Context-Free Grammar, spoken language syntax.

Module 4: Parsing [8L] Parsing: Unification, probabilistic parsing, TreeBank. Semantics: Meaning representation, semantic analysis, lexical semantics, WordNet Word Sense Disambiguation - Selection restriction, machine learning approaches, dictionary-based approaches.

Module 5: Discourse and Applications of NLP [6L] Discourse: Reference resolution, constraints on co-

reference, algorithm for pronoun resolution, text coherence, discourse structure. Applications of NLP: Spell-checking, Summarization, Information Retrieval - Vector space model, term weighting, homonymy, polysemy, synonymy, improving user queries. Machine Translation – Overview.

Course Title	Cyber Law and Ethics				
Category					
LTP & Credits	L	T	P	Credits	
	3	0	0	3	
Total Contact Hours	36				
Pre-requisites	None/if any				

Learning Objective:

Cyber law provides a framework for protecting individuals and organizations from cyber threats, ensuring the privacy and security of digital transactions, and establishing guidelines for ethical and legal conduct in cyberspace.

Course Outcome:

CO1: Understand the evolution of computer technology and the emergence of cyberspace, including the legal and technological significance of domain names and the Internet as a tool for global access.

CO2: Analyze the Information Technology Act, 2000, its amendments, limitations, and provisions related to digital signatures, cryptographic algorithms, electronic records, and certifying authorities.

CO3: Evaluate cyber laws and related legislation, including patent law, trademark law, copyright, and their implications for software, domain names, electronic databases, and civil and criminal procedures.

CO4: Examine electronic business and legal issues, including the evolution of e-commerce, paperless contracts, e-commerce models (B2B, B2C), e-security, taxation, electronic payments, supply chain, and emerging trends.

CO5: Discuss the importance of cyber ethics, the need for cyber regulations, and ethical issues in information society, artificial intelligence, and blockchain technologies.

Course Content:**Module-I: Introduction to Cyber Law**

Evolution of computer technology, emergence of cyberspace. Cyber Jurisprudence, Jurisprudence and law, Doctrinal approach, Consensual approach, Real Approach, Cyber Ethics, Cyber Jurisdiction, Hierarchy of courts, Civil and criminal jurisdictions, Cyberspace-Webspace, Web hosting and web Development agreement, Legal and Technological Significance of domain Names, Internet as a tool for global access.

Module-II: Information Technology Act

Overview of IT Act, 2000, Amendments and Limitations of IT Act, Digital Signatures, Cryptographic Algorithm, Public Cryptography, Private Cryptography, Electronic Governance, Legal Recognition of Electronic Records, Legal Recognition of Digital Signature, Certifying Authorities, Cyber Crime and Offences, Network Service Providers Liability, Cyber Regulations Appellate Tribunal, Penalties and Adjudication.

Module-III: Cyber Law and Related Legislation

Patent Law, Trademark Law, Copyright, Software – Copyright or Patented, Domain Names and Copyright disputes, Electronic DataBase and its Protection, IT Act and Civil Procedure Code, IT Act and Criminal Procedural Code, Relevant Sections of Indian Evidence Act, Relevant Sections of Bankers Book Evidence Act, Relevant Sections of Indian Penal Code, Relevant Sections of Reserve Bank of India Act, Law Relating To Employees And Internet, Alternative Dispute Resolution, Online Dispute Resolution (ODR).

Module-IV: Electronic Business and Legal Issues

Evolution and development in E-commerce, paper vs paperless contracts E-Commerce models-B2B, B2C, E-security. Business, taxation, electronic payments, supply chain, EDI, E-markets, Emerging Trends.

Module-V: Cyber Ethics

The Importance of Cyber Law, Significance of Cyber Ethics, Need for Cyber regulations and Ethics. Ethics in Information society, Introduction to Artificial Intelligence Ethics: Ethical Issues in AI and core Principles, Introduction to Blockchain Ethics.

Text/Reference Books:

Total Contact Hours	36			

Pre-requisites	c) Computer Networks d) Operating Systems
----------------	--

Learning Objective:

This course will introduce you to the basics of quantum computing through a practical approach. Participants will learn about qubits and gating operations, construct quantum circuits and learn about quantum algorithms.

Course Outcome:

CO1: Provide a basic introduction to quantum mechanics, including linear algebra and the Dirac notation, to establish foundational understanding.

CO2: Introduce quantum computation and quantum information, covering topics such as quantum entanglement, quantum algorithms, and quantum channels.

CO3: Explore rudimentary quantum computing using the IBM quantum computer and associated simulators.

CO4: Discuss quantum correlations, including Bell inequalities, entanglement, Schmidt decomposition, super-dense coding, and teleportation.

CO5: Cover quantum cryptography, specifically quantum key distribution.

Course Content:

Module I: Introduction to Quantum Mechanics

- Elementary quantum mechanics
- Linear algebra for quantum mechanics
- Quantum states in Hilbert space
- The Bloch sphere
- Density operators
- Generalized measurements
- No-cloning theorem

Module II: Quantum Correlations

- Bell inequalities and entanglement
- Schmidt decomposition
- Super-dense coding
- Teleportation

Module III: Quantum Cryptography

- Quantum key distribution

Module IV: Quantum Gates and Algorithms

- Universal set of gates
- Quantum circuits
- Solovay-Kitaev theorem
- Deutsch-Jozsa algorithm
- Factoring

Module V: Programming a Quantum Computer

- Introduction to IBM Quantum Experience (IBMQ)
- Coding a quantum computer using a simulator for basic quantum measurement and state analysis

Pre-requisites				

Learning Objective:

To develop an understanding of modern network architectures from a design and performance perspective. To introduce the student to the major concepts involved in wide-area networks (WANs), local area networks (LANs) and Wireless LANs (WLANs). To provide an opportunity to do network programming

Course Outcome:

CO1: To Perform information theoretic analysis of communication system.

CO2: To Design a data compression scheme using suitable source coding technique.

CO3: To Design a channel coding scheme for a communication system.

CO4: To Understand and apply fundamental principles of data communication and networking.

CO5: To apply flow and error control techniques in communication networks.

Course Content:

Module 1:

[5L]

Source Coding Uncertainty and information, average mutual information and entropy, information measures for continuous random variables, source coding theorem, Huffman codes

Module 2:

[6L]

Channel Capacity And Coding [7L] Channel models, channel capacity, channel coding, information capacity theorem, The Shannon limit

Module 3:

[6L]

Linear And Block Codes For Error Correction [8L] Matrix description of linear block codes,

equivalent codes, parity check matrix, decoding of a linear block code, perfect codes, Hamming codes

Module 4:

[5L]

Cyclic Codes Polynomials, division algorithm for polynomials, a method for generating cyclic codes, matrix description of cyclic codes, Golay codes..

Module 5:

[6L]

BCH Codes Primitive elements, minimal polynomials, generator polynomials in terms of minimal polynomials, examples of BCH codes.

Module 6:

[8L]

Convolutional Codes Tree codes, trellis codes, polynomial description of convolutional codes, distance notions for convolutional codes, the generating function, matrix representation of convolutional codes, decoding of convolutional codes, distance and performance bounds for convolutional codes, examples of convolutional codes, Turbo codes, Turbo decoding

CO5	2	1	1	1	2	2	0	0	2	0	0	3	0	0	3

Course Code	YCS 8002 F			
Course Title	Ad-Hoc and Sensor Network			
Category	Minor ENGG			
LTP & Credits	L	T	P	Credits
	3	0	0	3
Total Contact Hours	36			
Pre-requisites	Prerequisite: Basic concept of computer network and communication engineering Basic programming knowledge			

Course Outcomes (COs): After attending the course, students should be able to: CO1: Illustrate the concepts and workings of modern communication technologies. CO2: Demonstrate various routing algorithms for both infrastructure-based and ad hoc networks. CO3: Develop mobility and bandwidth management in cellular networks. CO4: Design and build an energy-efficient and secure mobile computing environment using heterogeneous wireless technologies. CO5: Predict technical issues related to recent mobile computing environments.

Unit 1: Introduction and Overview [4L]

- Overview of wireless networks, including types and infrastructure-based vs. infrastructure-less networks.
- Introduction to Mobile Ad-hoc Networks (MANETs), their characteristics, reactive and proactive routing protocols with examples.
- Introduction to sensor networks, commonalities, and differences with MANETs.
- Constraints, challenges, advantages, applications, and enabling technologies for Wireless Sensor Networks (WSNs).

Unit 2: Architectures [9L]

- Single-node architecture, including hardware components, design constraints, and energy consumption of sensor nodes.
- Operating systems and execution environments, examples of sensor nodes.
- Sensor network scenarios, types of sources and sinks (single hop vs. multi-hop networks), multiple sources and sinks (mobility, optimization goals, and figures of merit).
- Gateway concepts, design principles.

Unit 3: Communication Protocols [9L]

- Physical layer and transceiver design considerations.
- Medium Access Control (MAC) protocols for wireless sensor networks.

- Low duty cycle protocols and wakeup concepts (S-MAC, mediation device protocol, wakeup radio concepts).
- Address and name management, assignment of MAC addresses.
- Routing protocols (classification, gossiping, flooding, energy-efficient routing).
- Unicast protocols, multi-path routing, data-centric routing.
- Data aggregation, SPIN, LEACH, Directed-Diffusion, geographic routing.

Unit 4: Infrastructure Establishment

- Topology control, flat network topologies, hierarchical networks by clustering.
- Time synchronization (properties, protocols based on sender-receiver and receiver-receiver synchronization).
- Localization and positioning (properties and approaches, single-hop localization, positioning in multi-hop environments).
- Range-based localization algorithms, location services, sensor tasking, and control.

Unit 5: Sensor Network Platforms and Tools [9L]

- Sensor node hardware, Berkeley motes, programming challenges.
- Node-level software platforms, node-level simulators.
- State-centric programming, Tiny OS, nesC components.
- NS2 simulator, TOSSIM.

Total Contact Hours	36				
Pre-requisites					

Learning Objective:

To facilitate the students with the concepts of Indian traditional knowledge and to make them understand the Importance of roots of knowledge system

Course Outcome:

- CO1:** Understand the concept of Traditional knowledge and its importance.
- CO2:** Know the need and importance of protecting traditional knowledge
- CO3:** Know the various enactments related to the protection of traditional knowledge.
- CO4:** Understand the concepts of Intellectual property to protect the traditional knowledge.
- CO5:** Understand the traditional knowledge in different sectors.

Course Content:

Module 1:

[8L]

Introduction to traditional knowledge Define traditional knowledge, nature and characteristics, scope and importance, kinds of traditional knowledge, the physical and social contexts in which traditional knowledge develop, the historical impact of social change on traditional knowledge systems. Indigenous Knowledge (IK), characteristics, traditional knowledge vis-à-vis indigenous knowledge, traditional knowledge Vs western knowledge traditional knowledge vis-à-vis formal

knowledge..

Module 2:

[6L]

Protection of traditional knowledge The need for protecting traditional knowledge Significance of TK Protection, the value of TK in the global economy, Role of Government to harness TK.

Module 3:

[6L]

Legal framework and Traditional Knowledge (10 Lectures) A: The Scheduled Tribes and Other Traditional Forest Dwellers (Recognition of Forest Rights) Act, 2006, Plant Varieties Protection and Farmers Rights Act, 2001 (PPVFR Act); B: The Biological Diversity Act 2002 and Rules 2004, the protection of traditional knowledge bill, 2016. Geographical indications act 2003..

Module 4:

[8L]

Traditional knowledge and intellectual property Systems of traditional knowledge protection, Legal concepts for the protection of traditional knowledge, Certain non IPR mechanisms of traditional knowledge protection, Patents and traditional knowledge, Strategies to increase protection of traditional knowledge, global legal FORA for increasing protection of Indian Traditional Knowledge.

Module 5:

[8L]

Traditional knowledge in different sectors Traditional knowledge and engineering, Traditional medicine system, TK and biotechnology, TK in agriculture, Traditional societies depend on it for their food and healthcare needs, Importance of conservation and sustainable development of environment, Management of biodiversity, Food security of the country and protection of TK.

Course Code	YCS 8001 E			
Course Title	Big Data Analytics			
Category	Major ENGG			
LTP & Credits	L	T	P	Credits
	3	0	0	4
Total Contact Hours	36			
Pre-requisites	Should have knowledge of one Programming Language (Java preferably), Practice of SQL			

Learning Objective:

Understand the Big Data Platform and its Use cases. Provide an overview of Apache Hadoop Provide HDFS Concepts and Interfacing with HDFS .Understand Map Reduce Jobs. Provide hands on Hadoop Eco System. Apply analytics on Structured, Unstructured Data. Exposure to Data Analytics with R.

Course Outcome:

- CO1:** Identify Big Data and its Business Implications.
- CO2:** List the components of Hadoop and Hadoop Eco-System
- CO3:** Access and Process Data on Distributed File System
- CO4:** Manage Job Execution in Hadoop Environment
- CO5:** Analyze Info sphere Big Insights Big Data Recommendations.

Course Content:

Module 1:

[6L]

Introduction To Big Data And Hadoop Types of Digital Data, Introduction to Big Data, Big Data Analytics, History of Hadoop, Apache Hadoop, Analysing Data with Unix tools, Analysing Data with Hadoop, Hadoop Streaming, Hadoop Echo System, IBM Big Data Strategy, Introduction to Infosphere BigInsights and Big Sheets.

Module 2:

[8L]

HDFS(Hadoop Distributed File System) The Design of HDFS, HDFS Concepts, Command Line Interface, Hadoop file system interfaces, Data flow, Data Ingest with Flume and Scoop and Hadoop archives, Hadoop I/O: Compression, Serialization, Avro and File-Based Data structures

Module 3:

[7L]

Map Reduce Anatomy of a Map Reduce Job Run, Failures, Job Scheduling, Shuffle and Sort,

Task Execution, Map Reduce Types and Formats, Map Reduce Features.

Module 4:

[9L]

Hadoop Eco System Pig : Introduction to PIG, Execution Modes of Pig, Comparison of Pig with Databases, Grunt, Pig Latin, User Defined Functions, Data Processing operators. Hive : Hive Shell, Hive Services, Hive Metastore, Comparison with Traditional Databases, HiveQL, Tables, Querying Data and User Defined Functions. Hbase : HBasics, Concepts, Clients, Example, Hbase Versus RDBMS. Big SQL : Introduction

Module 5:

[6L]

Data Analytics with R Machine Learning : Introduction, Supervised Learning, Unsupervised Learning, Collaborative Filtering. Big Data Analytics with BigR.

Course Code	YCS8001B				
Course Title	Block Chain and Crypto Currency Technologies				
Category	Major ENGG				
LTP & Credits	L	T	P	Credits	
	3	0	0	4	
Total Contact Hours	36				
Pre-requisites					

Learning Objective:

The block chain technology course allows the students to explore the driving force behind the crypto currency Bitcoin. Along with the Decentralization, Cryptography, Bitcoins with its alternative coins, Smart contracts and outside of currencies

Course Outcome:

- CO1:** Understand the types, benefits and limitation of block chain.
- CO2:** Explore the block chain decentralization and cryptography concepts
- CO3:** Enumerate the Bitcoin features and its alternative options.
- CO4:** Describe and deploy the smart contracts
- CO5:** Summarize the block chain features outside of currencies

Course Content:

Module 1:

[7L]

Blockchain Architecture – Challenges – Applications – Blockchain Design Principles - The Blockchain Ecosystem - The consensus problem - Asynchronous Byzantine Agreement - AAP protocol and its analysis - peer-to-peer network – Abstract Models - GARAY model - RLA Model - Proof of Work (PoW) - Proof of Stake (PoS) based Chains - Hybrid models

Module 2:

[7L]

Origin of Ledgers – Types and Features of Distributed Ledger Technology (DLT) - Role of Consensus Mechanism - DLT Ecosystem - Distributed Ledger Implementations – Blockchain - Ethereum - Public and Private Ledgers – Registries – Ledgers - Practitioner Perspective: Keyless

Technologies, Transparency as a Strategic Risk, Transparency as a Strategic Asset, Usage of Multiple IDs - Zero Knowledge Proofs - Implementation of Public and Private Blockchain

Module 3:

[7L]

Anatomy of a Smart Contracts - Life Cycle - Usage Patterns - DLT-based smart contracts - Use Cases: Healthcare Industry and Property Transfer. Decentralization versus Distribution - Centralized-distributed (Ce-Di) organizations - Decentralized-distributed (De-Di) organizations - Decentralized Autonomous Organizations: Aragon, DAOstack, DAOhaus and Colony

Module 4:

[8L]

Crypto currency Regulation: Stakeholders, Roots of Bitcoin, Legal Aspects-Crypto currency Exchange, Black Market and Global Economy. Applications: Internet of Things, Medical Record Management System, Domain Name Service and future of Blockchain. Decentralization and Cryptography. Bitcoin and Alternative Coins A: Bitcoin, Transactions, Blockchain, Bitcoin payments B: Alternative Coins, Theoretical foundations, Bitcoin limitations, Namecoin, Litecoin, Primecoin, Zcash

Module 5:

[7L]

Bitcoin and Cryptocurrency: What is Bitcoin, The Bitcoin Network, The Bitcoin Mining Process, Mining Developments, Bitcoin Wallets, Decentralization and Hard Forks, Ethereum Virtual Machine (EVM), Merkle Tree

	3	0	0	4
Total Contact Hours	36			
Pre-requisites				

Learning Objective:

The main objectives of cyber security are to protect the confidentiality, integrity, and availability of information and systems. These are also known as the CIA triad and form the basis of all security programs

Course Outcome:

CO1: To learn cybercrime and cyber law

CO2: To understand the cyber attacks and tools for mitigating them

CO3: To understand information gathering.

CO4: To learn how to detect a cyber attack.

CO5: To learn how to prevent a cyber attack

Course Content:

Module 1:

[8L]

Introduction Cyber Security – History of Internet – Impact of Internet – CIA Triad; Reason for Cyber Crime – Need for Cyber Security – History of Cyber Crime; Cybercriminals – Classification of Cybercrimes – A Global Perspective on Cyber Crimes; Cyber Laws – The Indian IT Act – Cybercrime and Punishment.

Module 2:**[12L]**

Reconnaissance Harvester – Whois – Netcraft – Host – Extracting Information from DNS – Extracting Information from E-mail Servers – Social Engineering Reconnaissance; Scanning – Port Scanning – Network Scanning and Vulnerability Scanning – Scanning Methodology – Ping Sweer Techniques – Nmap Command Switches – SYN – Stealth – XMAS – NULL – IDLE – FIN Scans – Banner Grabbing and OS Finger printing Techniques.

Module 3:**[8L]**

Intrusion Detection Host -Based Intrusion Detection – Network -Based Intrusion Detection – Distributed or Hybrid Intrusion Detection – Intrusion Detection Exchange Format – Honeypots – Example System Snort.

Module 4:**[8L]**

Intrusion Prevention: Firewalls and Intrusion Prevention Systems: Need for Firewalls – Firewall Characteristics and Access Policy – Types of Firewalls – Firewall Basing – Firewall Location and Configurations – Intrusion Prevention Systems – Example Unified Threat Management Products.

Course Title	Web Technology			
Category	Major ENGG			
LTP & Credits	L	T	P	Credits
	3	0	0	4
Total Contact Hours	36			
Pre-requisites				

Learning Objective:

The primary professional objective of a web developer is to write code to make a website. They must employ various programming techniques and tools to deliver high-quality results. Web technology refers to the means by which computers communicate with each other using markup languages and multimedia packages. It gives us a way to interact with hosted information, like websites

Course Outcome:

- CO1:** Design and develop web applications.
- CO2:** Explain client and server-side scripting and their applicability.
- CO3:** Create scripts using JavaScript in a web page
- CO4:** Integrate JavaScript in a web page.
- CO5:** Design forms and check for data accuracy.

Course Content:

Module 1:

[7L]

Web Basics and Overview: Introduction to Internet, World Wide Web, Web Browsers, URL, MIME, HTTP, Web Programmers Toolbox. HTML Common tags: List, Tables, images, forms, frames, Cascading Style Sheets (CSS) & its Types. Introduction to Java Script, Declaring variables, functions, Event handlers (onclick, onsubmit, etc.) and Form Validation.

Module 2:

[6L]

Introduction to XML: Document type definition, XML Schemas, Presenting XML , Introduction to XHTML, Using XML Processors: DOM and SAX. PHP: Declaring Variables, Data types, Operators, Control structures, Functions.

Module 3:

[6L]

Web Servers and Servlets: Introduction to Servlets, Lifecycle of a Servlet, JSDK,

Deploying Servlet, The Servlet API, The javax. Servlet Package, Reading Servlet parameters, Reading Initialization parameters. The javax.servlet HTTP package, Handling Http Request & Responses, Cookies and Session Tracking..

Module 4:

[7L]

Database Access: Database Programming using JDBC, JDBC drivers, Studying Javax.sql.* package, Connecting to database in PHP, Execute Simple Queries, Accessing a Database from a Servlet. Introduction to struts frameworks.

Module 4:

[10L]

JSP Application Development: The Anatomy of a JSP Page, JSP Processing. JSP Application Design and JSP Environment, JSP Declarations, Directives, Expressions, Scripting Elements, implicit objects. Java Beans: Introduction to Beans, Deploying java Beans in a JSP page

Text/Reference Books:

Course Code	YCS8002B			
Course Title	Bioinformatics			
Category	Major ENGG			
LTP & Credits	L	T	P	Credits
	3	0	0	4
Total Contact Hours	36			
Pre-requisites				

Learning Objective:

To provide a national bio-information network designed to bridge the inter-disciplinary gaps in biotechnology information. b. To establish link among scientists in organizations involved in R & D and manufacturing activities in biotechnology. c. To build up information resources, prepare database on biotechnology and to develop relevant information handling tools and techniques.

Course Outcome:

- CO1:** Infer the biological problems using appropriate in silico approaches
- CO2:** Select the suitable tools or servers to solve the specific biological issue and curate experimental data.
- CO3:** Perform and analyze database and similarity search sequence alignment.
- CO4:** Construct and analyze phylogenetic trees
- CO5:** Use appropriate tools and packages to analyze varied range of biological problems.

Course Content:

Module 1:

[5L]

Introduction to strings, edit distance strings, string similarity, elementary commands and protocols, Scope of Bioinformatics.

Module 2:

[7L]

Sequence Databases And Their Use Introduction to databases, database search, algorithms issues in database search, sequence database search, parametric sequence alignments, sub optimal alignments, dynamic programming global and local alignment gaps, multiple alignment, common multiple alignment methods. FASTA and BLAST. Amino acid substitution matrices PAM and BLOSSOM.

Module 3:

[6L]

Evolutionary Trees And Phylogeny : Ultrasonic trees, parsimony, ultrametric problem, perfect phylogeny, phylogenetic alignment, connection between multiple alignment and tree constructions.

Module 4:

[7L]

Protein Classification And Structure Visualization : Overview of the protein structure, protein structure visualization, visualization tools and databases, protein structure alignment, protein classification approaches, tools for plotting Protein - ligand interaction.

Module 5:

[6L]

Protein Structure Prediction : Protein identification and characterization, primary structure analysis and prediction, secondary structure analysis and prediction, Ab initio method for protein prediction, protein function prediction.

Module 6:

[5L]

Applications Of Bioinformatics: DNA mapping and sequencing, gene predictions, molecular predictions with DNA strings, role of bioinformatics in drug design

Text/Reference Books:

1. David W. Mount. 2005. Bioinformatics: Sequence and Genome analysis, Cold Spring Harbor Laboratory Press.
2. Jones, N.C. and Pevzner, P. A. 2004. An Introduction to Bioinformatics Algorithms. The MIT Press

LTP & Credits	L	T	P	Credits
	3	0	0	4
Total Contact Hours	36			
Pre-requisites				

Learning Objective:

To study the kinematics, drive systems and programming of robots. To study the basics of robot laws and transmission systems. To familiarize students with the concepts and techniques of robot manipulator, its kinematics. To familiarize students with the various Programming and Machine Vision application in robots. To build confidence among students to evaluate, choose and incorporate robots in engineering systems.

Course Outcome:

CO1: Interpret the features of robots and technology involved in the control
CO2: Apply the basic engineering knowledge and laws for the design of robotics.
CO3: Explain the basic concepts like various configurations, classification and parts of end effectors compare various end effectors and grippers and tools and sensors used in robots
CO4: Explain the concept of kinematics, degeneracy, dexterity and trajectory planning..
CO5: Demonstrate the image processing and image analysis techniques by machine vision system.

Course Content:

Module 1:

[6L]

Fundamentals Of Robot : Robot – Definition – Robot Anatomy – Co-ordinate systems, Work Envelope, types and classification – specifications – Pitch, yaw, Roll, Joint Notations, Speed of Motion, Pay Load – Robot Parts and their functions – Need for Robots – Different Applications..

Module 2:

[8L]

Robot Kinematics Forward kinematics, inverse kinematics and the difference: forward

kinematics and inverse Kinematics of Manipulators with two, three degrees of freedom (in 2 dimensional), four degrees of freedom (in 3 dimensional) – derivations and problems. Homogeneous transformation matrices, translation and rotation matrices.

Module 3:

[8L]

Robot Drive Systems And End Effectors Pneumatic Drives – Hydraulic Drives – Mechanical Drives – Electrical Drives – D.C. Servo Motors, Stepper Motor, A.C. Servo Motors – Salient Features, Applications and Comparison of All These Drives. End Effectors – Grippers – Mechanical Grippers, Pneumatic and Hydraulic Grippers, Magnetic grippers, vacuum grippers, internal grippers and external grippers, selection and design considerations of a gripper

Module 4:

[7L]

Sensors In Robotics Force sensors, touch and tactile sensors, proximity sensors, non-contact sensors, safety considerations in robotic cell, proximity sensors, fail safe hazard sensor systems, and compliance mechanism. Machine vision system - camera, frame grabber, sensing and digitizing image data – signal conversion, image storage, lighting techniques, image processing and analysis – data reduction, segmentation, feature extraction, object recognition, other algorithms, applications – Inspection, identification, visual serving and navigation.

Module 5:

[7L]

Programming And Applications Of Robot Teach pendant programming, lead through programming, robot programming languages – VAL programming – Motion Commands, Sensors commands, End-Effector Commands, and simple programs - Role of robots in inspection, assembly, material handling, underwater, space and medical fields

Learning Objective:

To facilitate the students with the concepts of Indian traditional knowledge and to make them understand the Importance of roots of knowledge system

Course Outcome:

- CO1:** Understand the concept of Traditional knowledge and its importance.
- CO2:** Know the need and importance of protecting traditional knowledge
- CO3:** Know the various enactments related to the protection of traditional knowledge.
- CO4:** Understand the concepts of Intellectual property to protect the traditional knowledge.
- CO5:** Understand the traditional knowledge in different sectors.

Course Content:

Module 1: [8L]

Introduction to traditional knowledge Define traditional knowledge, nature and characteristics, scope and importance, kinds of traditional knowledge, the physical and social contexts in which traditional knowledge develop, the historical impact of social change on traditional knowledge systems. Indigenous Knowledge (IK), characteristics, traditional knowledge vis-à-vis indigenous knowledge, traditional knowledge Vs western knowledge traditional knowledge vis-à-vis formal knowledge..

Module 2: [6L]

Protection of traditional knowledge The need for protecting traditional knowledge Significance of TK Protection, the value of TK in the global economy, Role of Government to harness TK.

Module 3: [6L]

Legal framework and Traditional Knowledge (10 Lectures) A: The Scheduled Tribes and Other Traditional Forest Dwellers (Recognition of Forest Rights) Act, 2006, Plant Varieties Protection and Farmers Rights Act, 2001 (PPVFR Act); B: The Biological Diversity Act 2002 and Rules 2004, the protection of traditional knowledge bill, 2016. Geographical indications act 2003..

Module 4: [8L]

Traditional knowledge and intellectual property Systems of traditional knowledge protection, Legal concepts for the protection of traditional knowledge, Certain non IPR mechanisms of traditional knowledge protection, Patents and traditional knowledge, Strategies to increase protection of traditional knowledge, global legal FORA for increasing protection of Indian Traditional Knowledge.

Module 5: [8L]

Traditional knowledge in different sectors Traditional knowledge and engineering, Traditional medicine

system, TK and biotechnology, TK in agriculture, Traditional societies depend on it for their food and healthcare needs, Importance of conservation and sustainable development of environment, Management of biodiversity, Food security of the country and protection of TK.
